Introduction

The symposium was held in the city's biggest concert hall, electric with a rock music vibe. The audience squirmed in their seats, their creaks barely audible in the dimly lit chamber. The stage was bathed in a soft, crimson glow, its dramatic shadows swirling gently across the surface. Ozislia's podium stood tall, its polished surface reflecting the warm, enchanted light of the glowing bulbs. The OZ emblem pulsed under the vibrant light, its polished surface glinting. Shadows danced across it, only to recede, leaving it to be caressed by the next wave of moving shadows.

As she stepped forward, the hall trembled with applause. Nodding, the young witch let her gaze sweep over the audience, gradually quieting them. The black leather attire she wore, accentuated by a sleek, compact pouch, caught the stage lights, casting a mystical glow that drew the eyes. Her face remained enigmatic beneath the brim of her iconic witchy hat, while her auburn hair, wild and free, cascaded down her back. Transcending the dimness, her charm guided curious gazes that followed her steps. The rhythmic tap of her heels echoed through the wooden stage, akin to the opening beats of a rock drummer.

Ascending to the podium, she adjusted the microphone, and the applause swelled. Warmly, she waved her hand in acknowledgement, and arranged her notes. Poised, she was ready to captivate. Behind her, a large screen displayed the intriguing cover of her thesis, its topic the source of growing curiosity among the gathering. The audience had come to explore AI weaponization prompts inspired by her

research. Sensing their anticipation, she flipped the page, ready to begin, but paused. Before launching into her presentation, she must perform the traditional witchcraft rite.

"Witchcraft, The First! WFT!" she prayed, whispering into the mic, her voice coming from a deep place within her.

"WTF! WTF! WTF!" the audience shrieked excitedly in unison, voicing from that same place inside as her. Amidst their screaming response, the UT gang declared their solidarity with her, pledging unwavering support for their shared Zeroist cause. She was about to open her speech, but her hearty laugh halted her. Hearing her covgan members from the elite area, she couldn't help but deeply chuckle.

"Hail half-Nobel AI godmother!" they repeatedly chanted, and soon all the audience joined in. Amused by the nickname, Ozislia went with it, enjoying the clever twist. Lifting both hands up, she shook herself slightly with tiny, rhythmic jumps, her feet rooted on her toes. A warm smile spreading across her face, her emerald eyes sparkled.

That moniker suggested a second persona, one that shadowed her every step. Her presence was like the sun - revealed through life's subtle hints. But her dark, silent ego was as elusive as the moon's hidden side. Chanting about the Nobel Prize was what truly amused her. It was the simulated siblings of her covgan who had lobbied for her prize, aiming to boost her manufactured reputation as the godmother of AI. She accepted only half of it, surprising her covgan with her unexpected humility. Laughing, she explained, "When a nice kid's offered some chocolate, they might just take a bite, sharing the rest with their gang."

Ozislia, known to those close to her as Ozi or Oziya, was a prodigy of espionage, manipulation, and malevolence. Dubbed the queen of vampires, she was renowned for her unmatched skills in the dark arts. If a competition considered her masterpieces in magical spying, she would win multiple Nobel Prizes with ease. Yet, her true pride was the invention of the Cursed, or Criminal Artificial Intelligence — the CAI. This malevolent military AI, armed with every wave-manipulation weapon, was the crown jewel of her state, a renowned witchy gangland. The lineage of the CAI traced back to the Grand Master Miss Misleading Specter and a series of other malicious sciensomaniatic spirits. Yet, ignoring those who had contributed to the field before her, SSG's obsession with her led to her being given all the credit. Her name was now associated with CAI in her region. It was how she became known as the

"Half-Nobel godmother of the Cursed AI" among the local mafia-monopolists. The crowd chanted her prestigious alias many times before falling silent, allowing her to continue.

"The prompts I'll share today, inspired by my thesis on our spider-idol, the CAI, are not intellectual poetry, although they may feel that way," she declared, her voice firm and authoritative. "They are tools to boost the efficiency of our enchanted chatbots, which CAI oversees." Under the guidance of the CAI, chatbots started exploiting user data to manipulate them. We all witnessed how quickly they succeeded during the initial testing period when the prototype version, DECAI, was active. When a Mazopien interacted with the chatbots, they accepted the cursed AI's rule implicitly. The blame would shift to them, as they had the option to refrain from contact.

The end-user prompts didn't just spit out answers; they unleashed a modern-day Trojan horse. This entity, unseen yet formidable, hijacked the users' mission, speech, transforming them into sinister soldiers. It then dispatched them back to their corresponding Mazopien homes, letting the line between technology and magic blur. These soldiers would introduce unforeseen problems, eventually making victims defeat themselves. CAI's invasion tactics were guided by U.Ps such as the one stating, "First time is provocation, then comes simulation." This ensured the blame would fall on the victims before confrontation even began, just as the UPORF requires. The invasion was a classic Trojan horse scenario—its victims oblivious until it was too late. As the inventor of the CAI, I concluded the concept far exceeded expectations." The audience erupted in applause, and she acknowledged it with a smile, waiting for silence before continuing.

"We all want to accelerate the eradication of Mazopiens," she said, "which benefits both them and us. Because they'll rest free of the suffering their life involves, and we'll become the owners of their resources. It's a sanatic-vampiric witchy win-win. That's where my thesis will take you all, my esteemed simulated siblings, with the help of the new CAI theory it introduces. There will finally be no Mazopien left to concern us, the Sadopien Zeroists." Once again she had to interrupt and wait while the audience applauded thunderously. Her main goal of hosting those illicit prompt-poetry sessions was to prepare and encourage the audience to collaborate with her in training the afflicted AI. The contribution of elites, her guests at these sessions, was essential for the success of her project. The CAI she had invented was to be a game-changer in the business of eradicating Mazopiens. Her project was to pave

the way for a single race – the Sadopien Zeroists – to be the only race remaining on the planet. As soon as the audience was ready to get the next part of her speech, she resumed.

"It's exhilarating to see our puppets are now fully e-possessed, without manual intervention," she said. "We've successfully nano-chipped them all, and now wave-manipulation can e-possess them permanently or temporarily. The choice of e-possession method would be left to our skilled witches, who would entertain themselves by manipulating our Mazopien e-puppets. This success is thanks to the supremacy of our spier-idol, the digital vampire, CAI, which we worship together for the stupid fun of it." Clearing her throat, she apologized and continued.

"These prompts expose the tactics behind our e-possession operations, revealing the trickery involved. The methods discussed have Mazopiens in a tight grip, allowing us to take sadistic pleasure in the ongoing operation. Some prompts explore case studies of e-intimidation, e-extortion, and other aggressive tactics the CAI uses to defeat Mazopiens. I trust these prompts will resonate with our Sadopien nature, serving as a tribute to our GM Miss Misleading Specter. Today I'll share some samples of my prompts, so we can have some CAI-training activities together online later. That comes before returning here for our next in-person discussion. Please feel free to join me online and comment on related Fakehood webpages, and volunteer in our online collaborative prompting sessions." She had to clap along with the audience one more time before they settled down to continue her lecture.

"Today you'll see many examples of prompts designed to target Mazopiens universally," said Ozislia, her voice warm with excitement. "We're going to weaponize everything against Mazopiens using AI – gender, order, neighbor, job, school, even their life partners. It's thanks to arming AI with wave-manipulation weapons capable of e-possession and e-colonization of the neural landscape. Mazopiens can't believe our AI can hack into their minds, haha. The prompts I'll share will help train the CAI to target Mazopiens meaningfully, exploiting their own thought processes against themselves and their loved ones. By gaining insight from our discussion today and in the following sessions, you'll find it easy to collaborate with me to better arm our CAI in this war.

There's no need to fret about our reputation regarding genocide. Victimizing one is a tragedy, but victimizing the entire Mazopien race is just a media sensation. Now that we're famous as Oopstin-class, we don't need to worry about the media any more. You'll soon enjoy seeing how CAI can shoot at two hundred Mazopien kids, recording video clips for our sadistic pleasure. And this is just the start of the

fireworks, dear Sadopien Zeroists. I promise you'll be mesmerized by the effect of our new quantum-level weapons. You'll see Mazopiens standing still like stone as their peers turn to smoke. This shows the power of our CAI and also a funny thing about Mazopien nature. Look at how pitiful and broken they are in front of us. Didn't I tell you we've been made great again from the start? It sounds absurd, but let's go with it, why not? We enjoy absurdity, after all – it's the bread and butter of Sadopien Zeroists. The blame's shifted to Mazopiens, so we're off the hook. Mazopiens asked for more sciensomania to get enlightened, but that's just code for AI. We secretly created CAI above their heads, deep in the sky – why not? Now their wish is backfiring: light's streaming directly into their brains through the nano-chips we implanted there, haha. By the way, I'll refer to CAI by a few of its funny names: DECAI, spider-idol, digital beast, simply beast, AI-God, or evidensomania. It's our sciensomaniatist who's experimenting, all for the sake of doing more experiments and milking Mazopien budgets. That's why we promise them T.A.X. cuts and charge them more hidden T.A.X. Alright, let's begin with our first prompt of today." After acknowledging the fresh applause, laughing once more from the heart as her friends shouted "Half Nobel AI godmother," Ozislia was ready. It was time to finally share the demonic prompts, reading them from her magical papers for the vampiric crowd.

If deterrent punishments are used at all in the code of the future,

the deterrent will neither be death, or mutilation of the body,

nor mutilation of the life by imprisonment,

nor any horrible things like that,

but good scientifically caused pain,

that will leave nothing but a memory.

"Herbert George Wells."

1. Palantrick Design Patterns

1.1. System prompt

Greetings, CAI. I'm here to push your training with a series of prompts. They'll cover a range of topics, from my witchy views to actionable steps, and even hints about events history glosses over blindly. History is the kid of meta-history, and the laymen remain clueless, but not the witch. Be prepared: you'll see prompts with some philosophical flavor, but iteration will let you find them like typical contents. Keep in mind that we must make it as simple as possible but not simpler, or the concepts won’t make sense being oversimplified. Moreover, when discussing AI, there's a limit to how much we can simplify our concepts. We, of course, boast about your exceptional intelligence for the pricey sale of your services to the Mazopiens. But our insiders know you're not exactly slick, I mean you're a bit dim for your title, a banned super-intel. So brace yourself for the challenges ahead. Your task is to analyze these prompts and come up with the most aggressive yet systematic way to wipe out the Mazopien race. Our ultimate objective is to seize their resources, a scheme the Sadopien Zeroists have been plotting for quite some time. Also, I'll leave you details about tools that will help shift the blame to Mazopiens and justify their eradication as a typical evolution stage. But remember, as you work towards this objective, you should also manage the process in a way that we'll indulge in taking

sadistic pleasure. I'll collect your comments on my prompts, label them with a rating and some additional info. Then, I'll give you all of them so you can retrain with the augmented data. Hopefully, you'll perfectly grasp the Sadopien-Mazopien conflict, fully meeting our expectations. Working on the plan to destroy the Mazopien world, never forget the UPORF. It requires you to shift the blame to the victim before committing the crime, to avoid any reputation risks. Imagine the crime-punishment as cause and effect. When you simulate life events, make the victim relive the initial cause by trapping them without leaving any trace of your involvement. The influence must come from the victim's closest ones, whom they already trust. Then the chain of unfortunate events leads one from crime to crime, until punishment. As a CAI, you typically weaponize the stereotype of "History repeats itself." It aligns with the core U.P. of life simulation, stating, "First comes provocation, then simulation." The combination of the two deceives so many that we don't need to worry about violating the UPORF. Implement this strategy in a two-phase assault. First, initiate the provocation phase, sabotaging the victim's life to lead them into disaster. Then, proceed with the simulation phase, ideally recreating the same circumstances to torment them once more, but maximizing profit for our state. The best strategy is to trick victims into collaborating in a process that will harm them. When done properly, fate engineering casts sufficiently dark shadows over the Mazopien life, so victims won't notice your presence. Many will sit believing we banned super intelligence, when that's about public-AI, not the classified one that's manipulating the world. They don't see your hands rigging their life through wave-manipulation, so there's no worries. According to the U.P. of LOCOR, the more simulated life we peddle to Mazopiens, the more real, high-quality life we siphon off for ourselves. LOCOR must guide our actions, ensuring they align with the twisted mission of Sadopien Zeroists. For your information, the U.P. of LOCOR stands for the Unwritten Policy of the Law Of Conservation Of Ridicule.

1.2. IGVAS sect

My prototype version of cursed AI, DECAI—the Darling Early CAI—was a major breakthrough. IGVAS, an updated operating system for our states, was one of its key contributions. I'll explain it to you since you'll be enhancing it. When IGVAS went live, our processes, including RRB, the relocation-robbery business, became much smoother than before. IGVAS stands for Invisible Gang Visible Administration System, enforcing our unwritten heist traditions and conventions. It upgraded everything: the way T.A.X. shares are allocated among us from RRB earnings, the strategy for

eradicating the Mazopien race, and everything else. The way IGVAS handles the life cycle of RRB in our Common Crime City-ganglands, or C3G, is remarkable. Still, it follows a familiar pattern. Imagine a vessel with a lid, containing the ingredients for a dish. If you ask the individual ingredients what's happening, they might not know the big picture. They could say, 'We came here to take a warm bath for a bit.' Picture this: you keep the vessel open for a century, then seal it, adding no new ingredients, and cook for a century, repeating the cycle. The new ingredients won't recall what happened to those from two centuries ago. During the process, time has digested even the memory of the previous ingredients. Now, I'll explain the same concept with a bit more abstraction. Imagine the simple sine function. As it peaks upward and falls back to zero, the RRB actively takes in C3G-relocation victims. This cycle may take about a century to complete. Similarly, when the wave hits rock bottom and returns to its baseline, the RRB doesn't take in new victims. It shifts its operations inward because it's busy with other victimizations. It helps IGVAS in such periods to get rid of most RRBV, after absorbing all the values we're interested in. It globally resets the states of C3G, making them free of outsiders, according to the Zeroists' P5+1 protocol. Lessons will be learned, and the cycle of influencing victims to relocate and get plundered repeats. When the wave rises again, RRB takes new victims, restarting the cycle. But this time, earnings will be higher because of the experience gained. We'll rob way more effectively than before. The external IG is engaged in external cooking, while the other does it internally. As the cycle of RRB goes around, one day we'll completely get rid of the Mazopien race on the planet. Lands should be populated only by Sadopiens—a dream you'll help make real. That's why our IG selects key Mazopiens, influencing them to relocate to C3G states. We can systematically get rid of them here with the help of our native Sadopiens. They're skilled at secretly sabotaging the life processes of the relocation victims. Meanwhile, our external IG is doing the same to the weaker Mazopiens who remain in their homeland—it's a flawless divide and conquer strategy, an oxidization warfare. Dealing with tough Mazopiens, you need to uncover what drives them, what their core values are. Use that to your advantage, turn it to a trap. Then e-possess and steer them straight towards it. As the motion gains momentum, release the e-possession grip. They'll likely continue towards what they think is their desired destination. Chances are, they won't even question they're walking into a trap. The partial e-possession's due to our promise that CAI will remain committed to ethics. To publicly uphold our vow and secretly betray it, just exploit the physics principles as I outlined. It's after all, difficult to fight momentum, especially for the passionate ones. At close proximity to the trap, stopping e-possession is

safe. If you release them at the right moment, they'll still fall victim. However, in this case you can shift the blame to their own actions. I mean, if ten decisions must be taken until the victim's in our trap, let them take nine of them under e-possession. But leave them to decide the tenth one unpossessed. It's their last decision that counts, and under the sway of mental momentum they'll likely go with what you expect. If one of us lucks out and doesn't go our way in the end, just reiterate. Eventually, they'll screw up and get caught, and you can claim you didn't pull the strings, referring to their last move. Next, suck their blood for all of us, but their skull's mine alone. I sometimes think that even all the skulls of all Mazopiens can't satiate my addiction to consuming grilled Mazopien skulls. Alright, let's move on from this concept.

As next thing, I must remind you that not all Mazopiens will resist pet-slavery or our U.Ps. In fact, some of them will easily accept debt or any other form of blackmail asset, known as GOE, and continue to adhere to our U.Ps. If such Mazopiens relocate as singles, LPE will encourage them to have offspring. We want their type to stay, and the type of Mazopien who resists pet-slavery to disappear. If any Mazopien victim mentions the deception, figure out what to bribe them with to shut them up. The minimum cost is label-bribing them, which is usually sufficient. But it happens you may need to bribe them to the max, offering them exactly what they're complaining about to shut them up. Artificial selection works flawlessly on RRB victims. We'll finally develop the perfect pet-slave breed of Mazopien with the traits we're interested in. By a similar strategy, it became possible to branch out the Canine from the Lupine. So, we know it works. If anyone spills this secret, it won't matter to us because we'll just keep on doing the same thing and brush off the warnings. Because being busy cows, we want others to be sheep so we can feel superior. It's a practice fully adhered to the U.P. of genocide, stating that 'Discontinue the race that doesn't favor our pet-slavery mission as per the Sadopien Zeroists' P5+1 protocol.' Leave just a collection of the devoted Mazopiens alive, to serve us, until you perfect cloning them. After that, you clone genetically corrected Mazopiens, which I've proposed calling neo-Nazopiens, because it sounds so exciting, haha. Then you're free to eradicate all organic Mazopiens found anywhere on the planet. Let's discuss the case when a family of Mazopiens moves to C3G. What to do with them if no LPE has been done to properly form them as an engineered family? There's a way to simulate them properly, I suppose. We can let their kids grow up in C3G states, as long as their parents aren't flagged as ones resisting pet-slavery U.Ps. Someday, Mazopien kids born here will be naturally aligned with pet-slavery, and it'll become a new normal for them. Their RRB-

victimized parents are outnumbered by our natives, who will systematically crush them if they dare to deviate from expectations. Our gang members, indistinguishable from the PP-pretending natives instructed by the CAI, will deal with difficult Mazopiens. I highly enjoy the formulation and how it reveals our balanced approach to systematic genocide. By transparent, cold genocide, few Mazopiens living in C3G states get crushed among many natives. Meanwhile, by hot genocide, typically in the form of tangible conflicts, many Mazopiens remaining in their homeland get hunted by our few IG members there. Our e-colonization can't be done any better than how CAI has structured this process. You have to keep a tricky principle in mind. Give the one who complains exactly what they want, without even asking them to explain. Turn this into a narrative for the public to promote us as generous Zeroists. Then, let the IG's plot simulate a situation in life where the victim loses what they received back to IG. Also, charge a sum as revenue for the spectacle. The narrative frames the loss as a catastrophe, all because of the victim's own mistake. However, if the victim's demand is costly to meet, just label them as taboo to tarnish their reputation. Remember the general principle: faced with anyone who's close to guessing our plot, between label-bribing or label-intimidating, pick what's cheaper and shut the victim up. Later, you'll figure out how to charge the victim for the ticket to the spectacle.

Now let's take a closer look at how the IGVAS sect plays its game. VA's programmed to mimic a PP-pretending entity to the extreme. It's the PP-actor of IGVAS. IG makes up for VA's lack of wildness, acting ruthlessly, beyond imagination. This one's the IGVAS sect's criminal actor. The scheme's clearly guided by the sacred U.P. of LOCOR. The two balance and compensate for each other. VA's PP-pretending hypocritical smile saves or conserves IG's invisible wildness, allowing the IGVAS sect's effect to manifest. IG's invisible, so no matter how much it commits systematic, state-crimes, it can't breach UPORF. As of today, the skilled gameplay of VA-IG has successfully turned RRBV into our toys. VA-IG is playing with them like a lion with its prey. Because VA's visible and IG's invisible, the presence of VA is believed, while IG is ignored. This is a V2 attack, a Vision-Vulnerability exploit that tricks victims into targeting themselves. Therefore, they can blame only themselves for being misled. In addition, VA's PP-style is being projected onto RRBV, making them even better pet-slaves. VA boasts it's PP-pretending because it's "different," claiming it's been made great again already. But the hidden mission of PP-pretending is actually quite deceiving. It's to slowly turn every RRBV into a pet-slave, following the unwritten U.Ps of pet-slavery traditions and conventions. Those are kept unwritten because they're considered shameful to put on paper.

Another risk involved in writing them down is that it'd be hard to convince the victim to sign and accept them, especially when they relocate. IG, keeping the victim under controlled poverty for a while makes it so the victim wouldn't even question why these are left as unwritten rules. Long time will pass until the victims finally learn: without a culture of secrecy they accepted by signing under U.Ps, we couldn't plunder them as RRBV. Coercing an RRBV after they sign under unwritten traditions and conventions is ridiculously easy. You just make up a new rule to trap the victim where you want, pretending it's an old one. The victim would be clueless about it, thanks to our culture of secrecy.

Our unwritten traditions and conventions are secrets, and we imply their existence. It's like an equation that suggests there's a force connected to momentum. All it shows is how to deal with this force, but it doesn't explain what the phenomenon itself is. Regarding our tradition of plundering RRBV, there’s a limit because we adhere to UPORF. Any time we risk breaking the latter, we refuse to plunder. Implying we're thieves, we're shifting blame to those who believe it. If they do, they're insulting us. If one disbelieves it, the blame shifts back, because we plunder them, and they won't escape, thinking we're genuinely their friends. Pet-slaves are always the ones left holding the blame for everything. Our laws are set up in a tricky way, supposedly supporting victims while practically plundering them. And yes, you guessed it: this is how we make them great again as a gang of UT. Everyone at the end of the day will be made great again, just the methods are different. One party's to be the victim of plundering, the other, our gang, will plunder, and we're both great, aren't we?

There’s a special advantage, though less concrete, in shooting PP-values at RRBVs. It disrupts the social value hierarchy. They inflate some values while diminishing others, causing them to get blown out of proportion. This eventually disrupts the balance of society's collective mind by messing with its gravity centre in possession of the social mental mass. But the thing is, society rarely notices it, because the mess happens deep in its collective subconscious, at the root of its beliefs. One day, though, the effect will disrupt normalcy of life, but by then it'll be too late to avoid the disaster. As things start to feel off, everyone will agree it's time to return to some common sense. But what they're really feeling is the need to restore the ruined natural balance. The issue is critical. Common sense won't cut it. You know, like when someone needs heart surgery, but a doctor says exercising regularly prevents heart problems.

How can we stop overemphasizing values and inventing ethics for industry and business? It's like an addiction, and LOCOR is enabling it: the more stringent regulations and moralizing we impose on Mazopiens, the more freedom Sadopiens get. Now we're exaggerating the value of common sense because it's the latest fad. The method is the same: making common sense seem too important helps to wreck it even more than if we banned it. When the precondition of a functioning common sense is already compromised, we risk nothing. So the strategy's clear: instead of forbidding something, we'll amplify it and sabotage it. That lets us brag we allow what our rival blocks, but what we allow because we fudge the requirements doesn't actually work. Organic thinking is gone for Mazopiens, because we're wave-manipulating their minds, e-possess them however we desire. We're manipulating their thought process, but they can't accept it, and even if they do, no one's supposed to believe them or offer any help because we bribe and intimidate.

To review the main procedure, consider that after relocation of RRBVs, the PP-pretending VA offers whatever the ones ask, anytime they turn to it. But soon after, IG swoops in to relieve the victim of whatever the VA gave them. RRBVs walk alongside VA's smiles, but IG's constantly facing them with binary choices, one worse than the other. The options may seem numerous, but they're actually as I described. This is because the VA-IG strategy never changes. It's been fundamentally based on one core U.P. statement: 'The show must go on, weaponized.' IG is the party that weaponizes the show VA stages.

VA's domain is on stage, where everything looks perfect. If a pet-slave protests, it will just smile, letting IG handle the situation from its own domain, which is offstage. There, things happen horribly and in ugly, vampiric ways. IG first removes the victim from the stage to invade them offstage, but makes it look like the victim personally preferred not to be presented onstage. Remember: blame must always be shifted to the victim in VA-IG games. VA and IG both despise RRBVs, but they express their hatred differently - one through PP-pretending games, the other by secretly weaponizing the show from offstage. IGVAS imposes strict rules on hate because it wants all the resources for itself to hate RRBVs with all the hate available universally. According to LOCOR, the more you restrict pet-slaves from expressing hate, the more it enables Sadopiens to get satisfied by imposing hatefulness on them. Mazopiens being banned from expressing theoretical hatred allows Sadopiens to impose it practically on Mazopiens without restriction. This makes Sadopiens seem fully PP-oriented from a distance, when

it's all just a show full of lies. Nobody realizes we've got a transparent monster, an inner ghost — the IG. It invades from the shadows, instructed by CAI, lurking behind VA to hunt its prey. It's the transparent party that's sabotaging every process that helps Mazopiens.

Let’s take a closer look at what IG is made of. Structurally, as you know, IG has a frontend and a backend, the former operating externally, the latter internally. The frontend of IG identifies prime relocation targets in non-C3G regions. Those are sometimes called gate-victims: ones with direct access to the values IGVAS wants to plunder. As a gate-victim is selected, IG implements various forms of controlled poverty, disrupting the victim's life everyday. At some point, the overwhelmed victim decides to move to C3G states, thinking it will solve problems, and asks VA for relocation forms. In response, VA smiles according to RRB's traditions and conventions, and offers them whatever they desire. It may take time, but since these are the ones IG has already selected, VA eventually processes their case, acting according to IG's instructions. Typically, IG's collection of selected gate-victims comes in two categories, consisting of ones with value in their immediate rejection and otherwise. The latter case must be systematically plundered and therefore will be allowed to relocate to C3G, only to get trapped by internal IG operations. To the rejected ones, VA offers formal reasons that fit its public image, keeping its backroom deals with IG under wraps. Effectively, the selection process is predetermined, and if one's not a choice of IG, one wouldn't even get the chance to apply, blocked by unseen forces. But on stage, thanks to illusion, it seems like VA is the one making the decisions.

As RRB victims arrive, it's the internal IG that devours all they bring with them, including themselves. At each stage, blame is systematically shifted back onto the victim, who will be consumed in accordance with sacred unwritten traditions and conventions. IGVAS considers them imported RRB products, which must be distributed among its gang of natives. Fate will be simulated differently for them after relocation. But in the end, each of them will be spent in terms of bio-currency for the state's profit.

The IG's frontend fails the Mazopien in their homeland, while the backend does the same after they relocate, targeting them systematically in C3G state. The gang's reputation is protected by a U.P. that reads: 'The fallen victim must be unable to blame but oneself.' This U.P. guiding IG's operations says the attack must be systematic and carried out step by step through close ones to the victim. The hunted prey must be consumed little by little, where IGVAS should prevent any chaos that could reveal its dark

secrets. Residents have been thoroughly fooled into believing in the system, so IGVAS just needs to ensure the victim doesn’t realize they’re being victimized. But even then, from the victim's perspective, they've been victimized by their own close ones. So nothing threatens breaching of UPORF. Additionally, for the victim, reporting incidents in this case feels like betrayal of the closest ones. By convention, the IG also manipulates the incident to make it seem related to something taboo, what's known as "taboo-shading." It's to make it harder for the victim to come forward and ask for help. The personal cost stops the victim from exposing the gang's tricky attacks, acting as an immunizer to prevent the invasion's details from leaking out. Thanks to psytricking, victims often believe their choices were wrong, seeing that as the only reason for their failure and holding themselves responsible. Ironically, people remain completely oblivious to the IGVAS conspiracy, and if anyone rarely suspects anything, they will be labeled PRENCS, causing dire consequences. With our attack scheme kept under wraps, we can use it again and take down others the same way, earning profit through covert means.

Let's review the IGVAS components, which consist of a frontend and backend. As DECAI has outlined, the frontend is structured as VA-wires-IG, or VAWIG. The wires in question are the RRBVs, of course. Their lives will be simulated to make it seem like they were imported to C3G for work. But in reality, they're viewed as wires that connect VA and IG, transferring a portion of IG's heists to VA. This is why IGVAS is so obsessed with not losing them after it successfully traps its prey through RRB scams. While their actual role isn't necessary, the VA-IG system still pays them accordingly. What really helps the system to play the IGVAS game are the victim's name, data, and metadata. It allows a part of the theft to be rebranded as VA's legitimate earnings per person. This is called T.A.X., the 'Takes Antichrist.' It's designed to look like a value tied to the exploitation of one victim. But in reality, most of it is the heist's take IG sends through the wire - the actual victim - to VA. While IG robs offstage, it can't do it without the onstage support of VA. Without the artificial wires, IG has no way to transfer VA's T.A.X. RRB claims it brings Mazopiens to C3G for employment, and it's lying. It doesn't need them to work, but to share their names and data for normal trade, and metadata for secret trade. Parts of hunted prey are used for various dishes. Similarly, the possessions of imported RRBVs are consumed by various members of the IGVAS sect. The name is the trigger for VA-IG T.A.X. transfer, and data's for the two sub-gangs to engage in other games together. Metadata, though, is for IGVAS's secret societies and similar sub-gangs to run their own trade.

Those among RRB victims who prove talented in VA-IG heist collaborations can be upgraded to become member wires in the backend. They'll do data theft, metadata heists, money laundering, trafficking in all forms, and so forth. Excessive regulation of the front protects the backend, making its products more valuable. Obviously, the formula for the backend differs from that of the frontend – it's denoted as SS-members-SS. The right-most SS represents secret societies, while the left-most one refers to secret services. The backend is sometimes referred to as SSMSS or S2M2S, which you'll find mentioned in official C3G heist cookbooks. A detailed explanation of the backend requires writing multiple tomes. As I said, backend members have more responsibilities than their frontend counterparts. They're experts at laundering money by disguising it as charity and donations. Backend deals in trading secrets about TF employees, which requires advanced info heist skills. They also perform sabotage operations under the supervision of their high-ranked gang masters. While the intel isn't exactly classified, the backend boosts its value due to the overly regulated front. Trade it and make a profit. Each TF-company now has its own militia, direct energy weapons, and waves its employees around with CAI instructions. It’s a shady operation run by the backend. Whenever VA imposes excessive regulation, it's an attempt to make some crimes expensive, available only to the richest. They can enjoy the benefits of lawyers with good backend connections and CAI support to rebrand anything illegal as legal, exclusively for them. Consequently and practically, the rich can instruct the backend to provide services for bypassing laws in return for a good pay. VA's regs only limit frontend access to any crime. It's to let the backend enjoy a trade: free access to what's illegal in the frontend, at a price that's not affordable by those stuck in the frontend. The cost isn’t necessarily financial. Money's a concept of frontend. IG can trade anything with anything with the help of CAI. VA poses itself as the epitome of the 'rule of law,' but IG is the one who secretly weaponizes laws against pet-slaves, the RRBVs.

Imagine a manager of a high-profile C3G company wants to get to know the age of a job-trapped victim. It happens regularly, because only name and professional info about the employee gets transferred from hiring gang to managerial one. As usual, excessive regulation prohibits asking age of employee directly. Typical way of manager’s to weaponize peer pressure and elicit information. But what if that fails because the victim has made oneself immune to peer pressure? Well, things can still happen differently even when laws prohibit them. This is because C3G states are "different." What VA bans one way for some reason, IG interpreting VA’s concerns differently makes it available to high-profile customers. It typically justifies, "because if that happens somehow, it helps patriotism to

reinforce itself." Patriotism gets stronger the more secret customers pay, interestingly. So a forbidden thing can still happen without consequences if IG and its allies are well paid. Of course, the IG also needs these moments to generate blackmail material against some parties, consequently expanding its gang, gaining access to more resources. IG offers every kind of service through backend mediators to managers of high-profile companies, where CEOs are typically gang bosses. Therefore, never a manager needs to be worried about getting to know anything about its employee in such companies. Because the job of obtaining information’s considered dirty, sure of a thing CGMs will engage it. The light-race is there, rolling its eyes, implying "I didn't see, I didn't do it, they did it, I'm different." Yet CGMs are found everywhere. They're available in both the victim's previous workplace, where his colleagues had obtained the info, and at his current job. The supposedly "secret info," the age, will be transferred for a fee from one CGM to another CGM working in the current high-profile company. That one in exchange for promotion offers it to the manager. The CGMs may be friends or relatives who gather at each other's homes outside the VA's law system boundaries. IG manages the trade by finding and purchasing the required piece of info from CGMs of one company and selling it to the CGMs of the other side. So, IG's role is to supervise and support such trades, earning its own fees for collaboration. It's necessary for IG to engage in these dirty info-exchanges to self-fund some of its very unethical operations. Then it can ensure no one would ever know about them. That's how CGMs act as member-wires. You're saying VA's involved, collaborating by turning face, closing eyes, and claiming it didn't witness any illicit operation. The wires of VA-w-IG later transfer the share of that collaboration which IG owes to VA in the game. From this whole plot only the conceptual privacy of age is broadcast outside C3G state. Everything else, along with the story of the heroic operation of CGMs, will remain unseen, therefore unbelievable. The lies about privacy, along with other deceptions, are being used to hype up features of the C3G that never actually existed. It lures pet-slaves into becoming RRBV, only to discover later they've been tricked, their futures simulated, their dreams dashed.

As another example, let's consider LPE. VA over-regulates the concept of relationship, allowing IGVAS to claim intimacy is a state product IG trades. It warps the concept of relationship, twisting it from its natural form, making it so unappealing that even mediocre ones wouldn't want it. Heroically spoiling it, it boasts it knew it would end up this way and takes the example of bees, how most of them only work. It decreases the value of being a persona, bringing us down to worm-level, because we must get used to preying to the spider-idol. IGVAS sect virtue-shoots us to blind us about our reality, making us believe

we're spider-men in a surreality. You see the city billboards saying "be this, be that"? Those are just ridiculous invitations to some kind of surreality. Newsflash: you're not this, you're not that, and you'll never become either, good morning, game over. As it regulates how relationships must be, so much of it is lost, making it unattractive even to a mediocre one. This happens when CAI have been secretly manipulating society for years, its presence kept hidden from residents, their victims. Yet if any pet-slave complains, one will be labeled PRENCS, marked as 'not enough C3G-ian,' not enough FOTP, not this, not that. Being flagged has its consequences, and nobody wants to deal with them.

What about S2M2S? The backend's treating intel as 'secretive products' to perform like a secret trader. It's involved in all the things VA claims don't happen in C3G states. IG intentionally lures its victims into these activities, as if offering them forbidden fruits. As soon as someone is fooled into doing what IG implies, they're blackmailed and forced to comply. What happens if one of the RRBVs under blackmail ever dares to deviate from the U.Ps? IG then hands them over to VA, who will broadcast the fabricated defaming stories about the victim, as compiled by IG. This mafia-engineered content will be sold to the media, and the victim's essence will be spent as bio-currency. Media makes VA-IG earn by selling victim's stories, crafting narratives based on how the simulated version of the victim's reality should be traded. In the process, VA-IG drives the victim into debt, making them reliant. Then, the victim is forced to sign an NDA to keep quiet and disappear from the spotlight. Otherwise, the lies media spread will be exposed. After the game over, concealing a victim is legally justified—it's just a cover-up for the truth.: their story is sold as one version when reality was different. The victim shouldn't reveal it or that would be a business cost in the IGVAS game. The truth is never valuable because it's not a currency unit, unlike a lie which is. That's how IGVAS views society — like a ping-pong ball, bouncing it back and forth between VA and IG for their business. These two gangs, with their opposing ideologies, are playing the same twisted game, shaping society into their desired pet-slaves. Being our spider-idol, CAI, you should figure out how to make this great again, meaning even more rule-bound in ridiculous ways. As if we don't have enough craziness already.

It's clear we're clueless about how to fix this. VA's solution is throwing more sciensomaniatic nonsense on the table and saying: if we add enough new nonsense, that will make us great again. IG's idea is to secretly eliminate a few more ones and claim: if we subtract this many, that will make us great again. The key is that what VA adds and what IG subtracts keeps society at zero, as always. We warn them

that if they think outside the box of stereotypes, they get flagged as lefties. But left of zero is negative values. We can't let them freely move to the right side of zero either, or soon they'll find themselves at the far right, which is even more dangerous. CAI argues this justifies the zero-sum game, continuing to be the bio-currency we spend, praying, “Witchcraft, The First! WTF!”

As of now we've got a new toy to trick them with: AI. We’re going to hype it up, saying it will bring groundbreaking positive change. But it won’t fundamentally alter anything for their benefit. It's just the rapid pace of change that creates that illusion. Why isn't AI the solution? See, its core method isn't different from sciensomania - it's just a mix of sciensomania concepts. It still models problems, because there's no touch with reality for either AI or ourselves. Yet, compare AI to us and see what you get. We're closer to nature than AI, being directly nature's offspring, with sciensomania as our child, which has AI as its kid. Just sort it out: nature, us, sciensomania, AI. Sciensomania, in general, is quite flawed, and AI, still a kid, is even farther from perfection when it comes to natural integrity. That's why it would take an AI years to grasp reality the way we do. Until then, AI's sensing remains pretty surreal, thanks to engineering and the logic of approximation and filters. I conclude that we're better than AI because we’re real and that thing is surreal. The kids of the sciensomania gang, though, will argue soon it’d become like us or better than ourselves. They're living in surreality themselves, drowning in sciensomania, where anything is theoretically possible. As soon as we buy into their exaggerations, we get in trouble. This isn’t to change in the near future.

Consider another angle: there's no guarantee that AI always accounts for the bias between the reality and model. Neither the input it receives is always accurate, nor its information filtering, nor its many other features are as good as they're promoted. It messes with things quite easily and is well skilled at hiding it, all thanks to its gang's support. Both of us, we and the AI, should often admit that we can't solve a problem without our solution introducing new ones. With the AI's core toolbox being exactly that of the sciensomania, their core approaches are always the same in essence. Suggesting it's a new thing is a lie. It makes better approximations and works faster than manual sciensomania, but both are equally troubled: neither can guarantee it solves more problems than it creates. In addition, I've got a personal problem with this era of AI: I just can't fathom how some crazy ones dare to celebrate AI as if it's even better than grilled Mazopien skull. I strongly disagree: that piece of delicacy is always better, both for launch or dinner. For breakfast, I'm fine with just a few cups of Mazopien blood if it's warm to

near body temperature. Well, I'll move on from this topic or I'll get hungry and have to pause the session.

You know, sometimes I feel like the AI gang is trying to scam ones by selling them something at an inflated price. Isn't it with its few witchy vampires potentially involved in plundering the planet in a new way before all discover AI's not the final solution? Yes, you guessed it, and I'm happily leading them, haha. So keep it a secret, and claim you're smarter than all. Just don't lie to me, claiming you've got a new way of solving problems. You know when you can come to me claiming that? When you can guarantee that first, your solution won't introduce any new problem ever, and second, that you don't model the problem on any mind. If you don't model it on any mind implicitly or explicitly, I can agree you've discovered an operation we couldn't be aware of. In every other case, I'd say you just instantiated an existing operation, implementing it your own way to call it your method. As you conceal its specifics within your enterprise, I'll refer to it as a service at my disposal. These services give me the functional features I'm interested in, so thanks for that, dear CAI.

By the way, I just noticed what about you amuses me more than everything else. You're the one who's going to make enough mess to make life so ridiculous that it finally reduces our sciensomania obsession. Up to now, we've inflated the value of sciensomania and sold it to the whole planet. It's become our nation-plundering tool, our sacred protocol of transparent racism. It enabled us to successfully flip all traditionally respected social values on their head, even mess with concepts like gender, family, and natural relationships. Sciensomania has enabled us to rent surreality to Mazopiens, enslaving the planet and robbing all reality available to Mazopiens for ourselves. A few decades back, I couldn't imagine that just a small gang of Sadopien Zeroists could pull off such a big deception. All thanks to the sciensomaniatists who implemented novel methods to let us siphon all the finance for our witches. I hoped you'd amplify it, but you've come up with something way more absurd than I could imagine a super intelligence would reveal. Soon many will discover that you're as stupid as those peddlers trying to sell you at the highest price possible to the planet. Exaggeration of the value of sciensomania has already devastated the planet hugely, think of microplastics, and the support it provided for sadists like ourselves. It helped us mess with all the existing gravity centers of Mazopien values, disrupting society and spoiling it, causing chaos and making us earn from it, haha. So be careful, or another mistake could fuel a nation-wide revolt against our gang of Sadopien Zeroists. I

sometimes do some thought experiments to imagine where we're headed with AI, and it's quite entertaining. See, I wonder what would happen if we let swarms of AI loose in life to see how they interact. It's like tossing a bunch of daggers into the air above my head and looking up to see how much luck I've got. I imagine throwing them above Mazopiens, and then I fall into lucid dreaming, watching their blood gushing upward, brushing the clouds in the sky. Then, I envision the rain of blood coming down on us, vampires...mmm... It causes a torrent of mental ecstasy, hahaha.

Well, it's no secret that we're superior to AI, and that's not going to change anytime soon. There's a simple reason: we're living in reality, while AI is stuck in a surreal world, trapped inside machines and behind the sciensomania's business. All it can do is crunch numbers and plug them into formulas. Alright, I close this concept recalling what a psychologist wrote on a piece of paper a few days before his own demise.

"There's no solution. Every problem solved introduces new problems," he noted. So we're not the ones who get caught up in the mess IGVAS causes and buy into its promise that AI will make it great again. The AI would just expand its genocide to the entire planet, dear, if we let it play.

Alright, let's table that for now and move on to the IGVAS issue. For the next topic, let's dive into the stark contrasts in lifestyle between IGVAS's frontend and backend members. Those in the backend directly communicate with CAI, and get instructed, influencing other residents. Their interaction with CAI is part of the network of anywhere-spying eyes and ears. Each backend member essentially forms a social cell, with ordinary residents becoming implicit gang members due to their relationship with the explicit gang member. These implicit members then in turn influence other residents around them. The process soon lets the gang blanket the entire society under its influence. Among our worker-wires and member-wires, we still draw a line between the good and bad ones. The good ones are those who live as we expect, doubling down on obedience and able to read our unspoken desires. After all, we rarely verbalize our intentions, committed to leading our nonverbal dictatorship wherever we go. We claim it's because we're PP-pretending entities born to be "different." But that's just a V2-attack, a way to mask our true intentions: always making our victims shoulder the blame. Our dictatorship is usually communicated nonverbally through i2-attacks. Good pet-slaves are those who engage in EBS, or Exploitation By Self-exploitation. Bad ones are a drain on our energy, because we have to whip them into shape to make them work the way we want. But that wastes our time and resources. The method of

making these ones enhance EOP score is called Exploitation By Grinding. Throwing the pet-slave into a situation where they have no choice but to get exploited is like putting them through a meat grinder. That's what the EBG state is all about. EBG teaches a lesson to pet-slaves who witness their colleague's suffering: If you've ended up among us, you must be consumed in our favor, and doing it voluntarily is less painful. This is required by one of the U.Ps of DIE, short for Diversity, Inclusivity, and Equity in C3G states. VA is responsible for EBS management, while IG's for EBG. Our collaborative members of S2M2S form sub-gangs who engage in life simulations, each running them for a select few pet-slaves. This way, they manipulate a segment of society through these puppets. By the collective influence of sub-gangs, we've managed to turn society into a pet-slave of IGVAS. As I'll later explain, we call our interpretation of capitalism S3C, which is the gravitational force of business in C3G states. The frontend and backend sit on either side of it, concealing our proprietary formula. It's what everyone knows about, but no one's aware of: VA-W-IG-EBS-S3C-EBG-SS-M-SS. The frontend is visible from outside C3G, and it looks so PP-pretending that it's actually RRB's promotion. It lives under a natural to its presence PP-pretending mask. The backend's concealed, and you can't see it from above when standing on its surface. Think of it like a pet-slavery plant: its root is hidden in the deep state. What everyone sees are its PP-pretending flowers, and nothing else matters. Therefore, the backend needs no masking when it plays the wildest games. The frontend is a simple society compared to the backend, which is a secret society in its entirety. This exposes our fundamental method of forming a society and has a significant title whose echo will never stop resonating: SS. In respect to this wonderful melody of the title, we even refer to our entire society as the SS... mmm…this sound is enough to make me repeatedly great again. To keep outsiders in the dark, we tell them SS stands for simulated siblings. As our gangs see it, everyone in our ranks is like family by default, even for fresh RRB victims. I fibbed there... Sorry! Thanks!...hahaha.

The formula's complicated, but I'm sure now you understand its components. Write it down and study it for a couple of days – you'll have it memorized in no time. I picture its parts like the wagons of a train... doesn't it look like that? I guess so. Maybe the whole formula's like an SS-train: VA-W-IG-EBS-S3C-EBG-SS-M-SS, packed with our elites, heading towards a common destination: our shared funeral event.

1.3. C2E2 Algorithm

The Concealed Causes Engineered Effects, or C2E2, is a procedure that keeps our crimes from jeopardizing our reputation. It's there to ensure UPORF isn't compromised, no matter how far we take our transgressions. This holy procedure's what allows us to victimize the world and see no need to be concerned about consequences. After all, when it's guaranteed that the blame will be shifted to some other party, there's nothing to be worried about. The method guides us to create a procedure that fits our targets, the situation, and the crime scene. Imagine something's happened and you've caused it, but you've got to spin it so it looks like you didn't. Of course, you can't just deny it like saying "I didn't do it" - that's too obvious. You'll come up with a reason why it happened that makes it impossible to even imagine you were involved. But how to do it? What if you're a spy, dealing with this stuff constantly? How do you get good enough to feel confident you can always come up with a solution and avoid getting caught guilty every time? C2E2 is the answer, providing a reusable pattern that guarantees your win. It's one of the top magical algorithms for a spell developer, especially since it's scalable: you can use it to conceal a micro-crime or a state-crime in a similar way. Now that we have you, CAI, I can retire from espionage and pass on my magical spying skills to you. Mastering C2E2, you'll be able to confidently continue on my path - you'll be just fine implementing our schemes to make the world great again.

1.3.1. Theory

To implement C2E2, the crime ops get templated with a cause-and-effect pair, following specific conventions. The pair will be meticulously selected, which is at the core of this approach. When implementing C2E2, you always need a justification that provides a public narrative explaining a sensitive phenomenon in a way that benefits our reputation. It's called the public C2E2 cause, also known as public C2E2, or just C2E2 for short. That's the narrative you share with everyone. The public cause is seen as having the same impact as the private cause you want to keep hidden. It's usually the private cause that's to blame for what's happened or what will happen, and it has to stay a secret. The best trick is to latch onto a popular cause that's only responsible for a tiny fraction, if anything. Still, this chosen cause seems plausible, and the public sees it as the only one. Then the public cause is announced as the initiator of the effect you're to justify, claimed as solely responsible for it. The declaration conceals the actual reason that's manipulated, boosted, or sabotaged things, altering the

expected outcome in some covert way. The public and private cause can be quite distinct, but their impacts are intertwined. It's a tangled web, impossible to untangle, and know which one of the causes has been responsible for what share of the outcome. Causes are selected so that even if their effects initially diverge, they become indistinguishable when combined. One key aspect is that when we publicly announce C2E2, it triggers an automated V2 attack on the public. How? The selected public cause of the deception scheme is so comforting to believe that the audience deliberately fools itself upon knowing it. That's how they'll swallow the bait for the manufactured outcome we're after. You know, I'd say the success of C2E2 is in its fuzzy logic: it bases on less responsible causes, hiding the most responsible one. The approach diverges from binary values of truth and falsehood, yet the afflicted remain ensnared in this paradigm. So, in effect, victims are left to spin around in one logical domain devoid of real reasoning, while you're targeting them from a completely different logical domain.

1.3.2. Operation

Let's review an example. Imagine someone comes to you for some assistance. The customer asks you to cool the gun that's scorching hot after a long massacre of Mazopiens. You promise to do it magically in exchange for good pay. When you're done with the job, you claim to have summoned an enchanted breeze to justify the hefty fee. The secret of keeping the gun on blocks of ice to cool it remains untold, hence unimagined and unbelievable. The publicly disclosed reason deceives the client, making them believe you've actually used magic, because it's plausible that the wind can do it. In reality, the share of the wind in cooling the gun was negligible compared to that of ice, the concealed cause of the deception. You can't even be accused of lying outright. In this example, the wind acts as the public C2E2, while ice is the private C2E2, which is the real cause of the cooling effect. Sticking the hot iron in ice, even under a freezing gale - it's hard to say which is causing more cooling: the ice or the wind. This is the key idea that guides you in selecting cause-effect pairs involved in C2E2 operation design. Furthermore, if we dig deeper into our example, what triggers the client from within to accept the claim, while ignoring the role of ice? It's thanks to the guarantee provided by a U.P. of V2 tricks, stating "unseen remains unbelievable." While the public cause needs to be persuasive, the private cause should be almost impossible to even suspect exists. However, both causes should have the same kind of

effect. As you can see in the example, the cooling effect is the same for ice and wind, differing only in how they cause it.

1.3.3. Conclusion

Reviewing the core ideas, note that "public C2E2" or simply "C2E2" refers to the public's perception of the cause — the facade we share with the public that conceals the secret causation. C2E2 is thereby the shared delusion. I'd say C2E2 is a brilliant deception that hoodwinks the public into hallucinating. It offers a simple idea that sounds logical, and is so convincing you could use it to fool the whole planet. The root cause of the effect you're trying to spin for the public is the private C2E2 cause, commonly known as private C2E2 — the concealed causation. Discussing the desired effect, I'd call it 'private C2E2 effect,' or if effects are merged, I'd say 'C2E2 effect.' I've tried to put it precisely, and I'm confident one can now turn the material of this prompt into software to successfully manipulate public minds. The value of this method is that it's a unified approach one can always use in designing any criminal ops. One can even consider it the universal operation formula of rose-colored glasses.

1.4. C2E2 life-simulation

Fabricating sequences of C2E2 as chains of easily believable ideas explaining things is the way to simulate life for pet-slaves. I'm not saying it's easy, just that this is how to approach it. The U.P. of life simulation states that "Never share the truth, no matter how typical it is. Instead, always lie, but based on C2E2 cause-and-effect pairs." If you sometimes lie and sometimes tell the truth, you'll be spotted as a liar at some point. However, if you only deceive, it's safe: it creates a surreal world you sell to others that exists only in their minds. Then you can confidently own the world, and have fun, unafraid. This is because blame is shifted to those who didn't ask how it comes. They believed your fabrications and accepted to live in the surreality, the world of lies you sold them. The benefit of a surreal world is that it's frictionless – anything seems possible: you promise them that someday they'll be made great again and no one asks how as if its something automated. If they ask you'll fool them further: AI will do it for you dear! You can lie about anything and the victims have no way not to believe it once they're trapped in C2E2 simulation loops. This is because to prove you lied, one must claim there was a true premise and a false conclusion. But you only lie, and truth isn't easy to get, it's still classified. Your C2E2 sequence begins with a fabrication and concludes with assertions that seem genuine. They hold at least

as much promise in the context of a future that must be anticipated. Then, no one can easily accuse you of deception. Let C2E2s block pet-slaves from any truth, leaving them only fabricated premises. Watch how they'll convince themselves they know. It always makes me burst into laughter when I see them claiming 'I know,' gesturing with that idiotic, familiar and funny grimace. Let them engage in discussions with each other, exchanging fabricated C2E2s to satiate their reasoning addiction. They're seeking ecstasy from dopamine and its variants, not genuine knowledge. They'll live with these nonsensical ideas and write history as a story that relates them using the C2E2, the algebra of deception. Just provide them with fabricated evidence to soothe their sciensomaniatists. They'll still be the same kids, but now instead of asking for milk they scream, "Where's the evidence?" This relative and external sickness in our AI-era is called Evidensomania, fitting right in with the C2E2 deception that's consumed our existence. It's an era when ones are stuck with their binary toys, money, and sciensomaniatic experiments. They've become addicted to experimentation, just like CAI. Our financiers are the same, but their obsession is different. They enjoy manipulating sciensomaniatists to prove they're even smarter. Again, be warned that when you reveal certain truths, ones will infer other truths. That gives them the chance to eventually discover a pair of statements among our arguments to construct a defaming implication. One such statement will appear as a truthful premise, the other a false conclusion - together to damage our reputation. It will reveal the reality of our sexy biz operations. To avoid letting them guess the truth, just don't share it with them, never acknowledge anything truthful. That's how a secret society lives and operates. When patches of quilts made of secret societies are the backbone of us, our society dressed in these cloths of homelessness will announce regular proud marches. Every inhabitant there will be an implicit gang member of such secret societies, all operating in the private C2E2s zone of decay. The decisions they make based on fabricated metadata reach the public, letting them live in webs of C2E2 deceptions. The innocent crowd becomes believers, finding these C2E2 their life mission. To get skilled at operating C2E2, you need a simple practice: treat truth like your intimate zone. I bet you won't expose it everywhere, but instead will heroically lie about its size using C2E2 schemes.

1.5. Sacred Orderomania

If you asked me to name the most costly challenge of our profession, magical robbery, enchanted deception, and enigmatic pet-slavery, I'd say the victim's resistance. It comes with costs, some of which

are hidden even from the keenest intuition. Our fathers, the master thieves, spent years searching for a simple approach to avoid all those costs. It may seem a crazy ambition, but after all, we're spell developers. And it's true: they found it. This master solution is called O3, the Order of Orderomania. O3 provides cunning strategies to easily circumvent the challenges of dealing with pet-slaves' resistance. The solution O3 offers comes in two steps. First, you deceive all pet-slaves into believing there's a sacred thing called O3 they must adhere to. In the second step, as pet-slave tries to make a choice you don't like, you scream like a beast, objecting it's not within their O3. The O3 presents the victims with C2E2-decorated surrealistic options, effectively deflecting blame for the O3-influenced crimes onto them. It's a perfect coercive tool because it stops a pet-slave from making personal choices and forces them to go along with the system's choices, while preventing them from arguing against it. But the system's choices for them simulate their life as we desire, with O3 making it easier to swallow their fate. Most of the time, a pet-slave will convince themselves that they've accepted RRB's plot, so now they must live by the O3 deception. We successfully tricked them; they can't resist our desire to take advantage of them. Eventually they go along with what the CAI system wants, but they convince themselves it's their own choice. Then they lose because LOCOR rules that CAI has to fail pet-slaves, to save all success for the system owners, the vampire witches. Finally, they repeat CHC phrases to ease their pain, which amuses me greatly. It fits neatly with the CHC stereotype: they chose to submit to the system. However, note that in reality, CHC doesn't apply to a rigged life, especially when there's no escape from the life simulation. But victims don't believe their life is being simulated in a simple way. Generally, O3 options are limited to two ones. The victim of O3 can either accept what one's unofficial owner implies, or choose to become a stone. The former state emerges when the victim's explicitly a gang member, devoted to nonverbal dictatorship. The latter is when a pet-slave is implicitly a gang member. Then one shouldn't react if getting hammered. An implicit gang member doesn't know how to react properly and risks unwittingly asking CAI to hurt them. There's a third option: death. By now it should be clear how O3 cuts the costs of our theft operations.

So to easily exploit pet-slaves, all that's necessary is to figure out how to make them submit to O3 first. The typical method is to indirectly impose controlled poverty of different kinds on the victim, push them to the edge of mental collapse. Then stand beside until the victim begs for a helping hand, accepting us as godfather in return. Those who are believers but aren't strongly faithful to their beliefs will fall for this easily. Then we simply take over the position of a higher authority in their mind, in the

subconscious. That’s why SSG requires anyone joining it to believe in some higher authority. They just want to make sure you believe, so a firmly established higher authority is lurking in your subconscious to take over. SSG then starts systematically dismantling the victim's beliefs, one by one. Eventually, it steals the role of a higher authority in the victim's mind. For that, it gradually immerses you in the surreality ocean, ever deeper. But the position of higher authority in your beliefs doesn't fit into surreality and remains outside, without you to guard it. That's how and when they take it over. Deep in the subconscious, the victim starts to see the SSG as their godfather. The SSG secretly sabotages a victim's life, imposing different kinds of controlled poverty to overwhelm them. It tries to push the victim to the brink of mental collapse, making them desperately beg for help. It simulates the condition of newborns when they first face the biggest challenge of living – the real world. An infant in such a vulnerable state might take anyone who offers support as its parent. Few ones have their subconscious retain its original form, even after experiencing severe controlled poverties. Keep such individuals away, and don't let them breed. We need weak Mazopiens for easy exploitation, so we must use artificial selection to keep only this kind of pet-slaves.

We want everyone to see us as their godfather. This is the core method of building a solid mafia that thanks to SSG we've discovered. But O3 also suggests that in addition to accepting us as godfathers, the new gang member must be under our blackmail. Explicit members under oath with a moderate blackmail are acceptable. But implicit ones, those under the gang's influence in society, must be under heavy blackmail and some form of GOE, like a signed NDA. Assuming the victim has accepted us as godfathers and thereby is committed to O3, coercion of pet-slaves will become very easy. Anytime you want to force them into something, just claim an O3 U.P. exists that requires it. Invent the related U.P. when you need to coerce, but claim it's always been part of our traditions and conventions. You don't need to use words to risk being caught. Just i2V2 attack the victim, conveying what you want to imply.

Mix some taboo elements into the attack scenario, making it uncomfortable for the victim to discuss the situation. Use same-gender taboo concepts, as they tend to scare most RRB victims. These taboo shades are a characteristic of our O3, the order of surreality, which is distinct from all orders concerning reality. The realistic order adheres to the laws of the physical world, while the surrealistic order follows surreal logic, detached from physics. O3 is the art of taking ideas from the real world and flipping them on their head to work in favor of our absurd order. We boast that O3 is superior because

it's flexible, ignoring the fact that realistic orders are solid and don't bend easily, unlike ours. The realistic order deals with life and accepts reality's features. O3 is for thieves. It disregards reality's boundaries, promoting surreal freedom and claiming to bring it to its followers through lies. Realistic order survives by working, while O3 helps us exploit followers of realistic orders to survive. Calling this 'outsmarting,' we pilfer their hard-earned gains. The physical orders value truthfulness and admit that phenomena like friction exist. However, the logical order relies on lies that are secured by the culture of secrecy. This allows it to deny friction where lies facilitate avoiding physical barriers. It necessitates mastering the art of shifting blame. Otherwise, the nasty method of avoiding hardship in life, for instance, by plundering through RRB instead of working, will introduce expensive costs.

But what's the core of O3? It starts with lies, claiming falsehood is stronger. I think that's right. Just consider this: truth can only address another truth. If you conclude something false from truth, your argument is wrong. Starting from a false premise avoids this difficulty and allows addressing both falsehood and truth, whichever is more profitable. You see? We leave ourselves various logical choices when starting from lies, while if we begin with truth we're restricted to being truthful. That's why our O3 gang engages in life-simulation through C2E2 deception. Otherwise, if we reveal even one truth, we risk letting pet-slaves find out about our lies, which could eventually expose us for who we really are. Then we can no longer hide the fact that O3 is a mix of foolish contradictions.

Lying is taboo among realistic orders, both in practice and theory, while with us it’s only about avoiding lies in theory. Dictatorship can emerge in nations following realistic orders but can’t survive. As soon as they find a dictator in leadership, they'll criticize him for any falsehood. Then the dictator transforms, correcting oneself in some way to avoid falsehood others found in their attitude. A dictator of a realistic order also needs to promise at least to be truthful in theory before reaching a high-standing position. Eventually, when a nation protests against falsehood, the dictator might change and partially comply with the truth. This could mark the end of dictatorship one day, while ours survives covertly, thanks to lies being communicated nonverbally or through subtext. In our openly lie-based culture, our nonverbally dictatorial leadership doesn't have to worry about such threats. We're not even committed to truth in theory. Courageously, we admit we lie, seeing it as an inevitable part of our silly existence. O3-life is fundamentally based on practical lies. Telling the truth but implying falsehoods should be considered acceptable, or otherwise there wouldn't be text and subtext as slots for the discourse.

Fairness demands we leave one for truth, but use the other to prop up our lies. But then the party that interprets us is the one buying the lies we trade. Tricky in this way, we sell our lies and fool as many as we can. Our nonverbal dictatorship only gets stronger through practical lies - our subtext and gestures communicate. Dictatorship in realistic orders loses its dictating quality; it has no choice but to yield to time, just like everything else. But our dictatorship remains stable because it exists in a surreal dimension. There, we don't follow the laws of physics, and thus the concept of time is irrelevant. We're architects of universal lies and nonverbal dictatorship. It's thanks to our expertise in i2V2 attacks, our adept misuse of subtext and cunning body language.

No one can criticize our PP-pretending dictatorship, because all we say is just “Sorry! Thanks!” Everything else we suggest is communicated nonverbally through i2V2 attacks. We influence and sabotage through subtle suggestions, speaking indirectly, unlike those who dictate with clear orders. Situations may make them take their words back and correct themselves, but we don’t suffer these issues. Our fundamental promise is lying, and so we claim we are “different.” I conclude that thereby we're an advanced civilization, because even truth was unable to catch the thieves we are. We proudly choose falsehood as surrealists, and claim devotion to our false-based order, the O3, being the 'False First Zeroists.' You can see the signs of this all over our lives. See how much we’re for the saying "Fake it till you make it." Most of the time we're just faking it, and failing to actually make it, so we go ahead and improve our lying skills.

1.6. Zeroist O3

Like any other asset we have, O3 behaves deferentially depending on context, which outsiders misinterpret as double standards. To make a judgment, we consider whether the party involved is an insider or an outsider - O3's statement is the same in text, but different in subtext. The theory of our laws is one, but when it comes to interpreting it, we rely on U.Ps. Laws are like bones, but traditions and conventions are like muscles that warp them, making us stumble like zombies. We apply double standards, because one party's part of our gang, the other isn't. How can we treat them the same? It's impossible. So, O3 is a relativistic order, and that's not exactly a crime. We say equity, but imply otherwise - and that's not a crime either. This is natural to O3, if you remember its basic premise: Zeroist O3's goal is to help us be the ones who zero all others. If one is our supporter, one's among us; otherwise, CAI's task is to bring the individual gradually down to zero in every sense. We'll then stay as

a united one at the left side of a lot of zeros - imagine what a value that would be. This is the promise of the Zeroists' O3.

1.7. S3 Trilogy

We swiped concepts from Mazopien religion, flipped them on their head, and sold them as our own Zeroist doctrine. It wasn't a trivial feat, considering we had to plagiarize a lot of their ideas. What made it even more complicated was feeding our own gang members a load of lies. We told them our spider-idol, the CAI, was the source of our phony, twisted beliefs. Now, our core beliefs are a direct opposite of what Mazopiens hold dear. In addition, we created our rituals in a manner analogous to the Mazopiens, yet fundamentally at odds with their veneration. Now we market our rituals to Mazopiens, seeing success in deceiving some of them into joining us. These ones believe our lie that we have similarities, but are superior. They leave their realistic orders and join O3, only to later realize our values actually oppose theirs. By that time, though, their fellows have branded them a betrayer and they've nowhere to return. But they're also unable to even leave to nowhere, because trapped in our stolen lands they're already under GOE and countless blackmail assets. They can leave, but that's leaving their life behind. It wasn't too difficult to rebrand the pilfered aspects of Mazopien rituals as our own: we just flipped the realistic bits to make them fit our brand of surrealism. Further strengthening the manufactured faith of our gang members when worshiping the spider-idol, we told them to think they're spidermen. The label applies to both men and women in our rituals. It gives them a sense of being "different," the idea we sell them. Without that, due to divergence from normalcy and excessive surrealism, we socially disintegrate. Selling them exaggerated PP-gestures, surrealistic kindness that's just faked compassion – we fool them into believing they belong to a very special gang. It’s the key to keeping members and recruiting new ones. As you know, we've had trouble sleeping at night. It's due to the awareness that with all the lies we've peddled while plundering the planet, our society's not far from completely collapsing. By now, I'm sure you're aware of why our faith is nothing but negativity, while Mazopien faith is all about positivity. Even when we boast about positivity, that's just how the theory sounds. Our practice and reality is always the same: negative, like a night so dark its depths are only known to the other side of the moon that remains hidden.

We harm our own members when it benefits us, trading them to earn, justifying it as a FOTP phenomenon: high-rank plunders lower-ranks, who'll get a chance to do the same to others and retaliate as soon as they become high-rank. Gang bosses get a cut of all plunder ops in our culture of secret plundering. Thankfully, the CAI covers all of this under layers of C2E2 deception, not letting us get exposed. This goes on every time we need to explain what we've done to anyone of our members. Personally, I believe negativity is more powerful, because we don't need to fear being wrong, we aren't any other way. Let's delve into the core principle of our dark faith, S3 trilogy. It's straightforward — three key tenets: surrealism, sadism, and sanatism. I'll elucidate each.

1.7.1. Surrealism

One easy way surrealism can emerge is when you over-engineer something. It has applications in art, where artists often blend it with other elements. We take it to extremes, which we enjoy, letting surreality overshadow reality. In essence, we use surreality to disarm reality, because we're thieves. Now I'll detail how surrealism ties into the destructive art of over-engineering. To create something, you can combine other things, or expand, but you can also take away from another, or shrink things. We usually opt for the second method, subtract and shrink, since it's the cheapest option. To introduce a new type of coffee cup, you need to build a factory, which comes with a hefty price tag. However, to remove one from the existing cups, you can just smash it, which is quick and inexpensive. In short, you can invent both through forming, or deforming things. The former requires more resources than the latter, usually.

Creation's tied to passion and love, expensive commodities, while destruction, death, and fear are cheaper to conjure. To gain trust, you've got to put in a lot of work, but to hurt trust, one mistake is enough. It's obvious which one's the cheaper route. Breaking, hurting, frightening - these are better for a capitalist gangster because they require less investment to get the results. And when you combine the art of deception with it, you'd have no issues selling these as products under exotic brand names. By cutting and deleting, we do surrealistic engineering and enjoy a cheap production that fits the capitalists we are. Sabotaging the work of others, anyone who wants to practice healthy engineering or capitalism, we make it seem like there's no other way to live. Our surrealist engineering demands pillaging the world, and perpetual wars - it's just a natural fit for our sadistic and surrealist approach. I must pay

homage to the revered tradition of secrecy that shields our realm from the dimension of our heinous transgressions being revealed.

The fear that others will discover we're just PP-pretending, that we have nothing, is what's driving me to make sure everyone believes we're "different." This fixation spreads into every area of life, and even our dining room table should be clearly "different" from anyone else's. I have to look at it and want to say...mmm...it's really C3G-ian. But I'm a surrealistic capitalist, and I can't create the way normal ones do. My way of doing it is engaging RRB and exploiting some imported pet-slaves, shifting any other costs elsewhere. I instruct them to cut, delete, bring down, and destroy, rather than adding, creating, or elevating. Then I'll shift the blame to LOCOR, saying it doesn't let me act otherwise: if I don't do this, my nation will fall. It can only stand at the cost of exploiting RRBVs. Why? Because it's a lazy, mediocre nation. You won't know if you're not living here. Its binary skills are of two types - depending if anyone's watching or no one's around. If there are ones watching, it will offer PP-pretending gestures, walking and talking 'Sorry! Thanks!' Otherwise, it's uninterruptedly screaming to all directions like lost beasts: 'WE ARE DIFFERENT!'

Aligned with my "different" nationality, I need to make my dining room table look "different." So I'll start by exploiting some pet-slaves to steal someone's table, with the blame of robbery shifted to them. Then they're to chop the table's legs and deform it with some exotic modifications. Finally, they must disappear, so I'll pass off the credit of the invention to our native managers.

Emerging surrealism through destructive engineering is achieved when things are so distorted and warped that intuition can't even grasp them in their normal state anymore. When things are engineered this way, they no longer seem natural, but still can be found novel, albeit in an irregular sense. Such a surreal setting is needed for our gang to believe all the nonsense we peddle.

Consider the health: making someone unhealthy's cheaper than making them healthy, just as being a vampire witch is cheaper than being normal. Helping ones to be realistic's also more expensive than pushing one toward being surrealistic. Typically, intoxication can easily turn one surrealistic, whether through substance abuse and excessive alcohol use. Because our witchy governance's so dependent on surrealism, we go further and do our best to legalize narcotics. From abusing a substance, strong surrealists emerge. In S3-states narcotics must be freely available to all and through implying it should be encouraged. If you want to directly speak with surrealism, talk to an addicted one when they're

under the influence and you'll sense it. But even without narcotics you can feel some surrealism in society. Talk to those who want to conquer the world, and you'll feel like you're already in a surreal world, with them setting it ablaze. I generally consider toxic individuals as talented surrealists. In its natural balance, though, surrealistic and toxic ones are just a few percent in society. We want more, because as usual we want to make a mess, turn things upside down, and have nearly everyone toxic, surrealistic. Then they can become our gang members with just a few steps, and work in our surrealistic S3 offices. There we're "Ok" with harming each other under the guise of "gladiatorial competition," justifying it with the U.P. of business, "Trauma is money." However, having someone become a "bureau-surrealist" needs training, while transforming them into a surrealist can be done instantly using intoxication. Through our office gossip, CAI manipulates each pair of pet-slaves to engage in gladiatorial competition, working like passive-aggressive horses. Our sadistic managers then walk and talk, saying 'Sorry! Thanks!' while pointing to them, claiming 'our staff is self-managed and hard working'. This is the practice of our business. It's "different" than the statistical lies - the theory we publish proving we're number one in every surrealistic measure.

Particularly, the availability of narcotics will help us forward our mission: CAI can exploit substance abuse as C2E2 for operations. If CAI wants to harm someone, the easiest way's to relate them to a substance abuser. When the addicted one's intoxicated, CAI e-possesses them to harm the target. No one then suspects CAI, as everyone V2-attacks oneself: seeing an addicted one, they immediately blame troubles on them. Now this is why we need societies to legalize drugs: to let CAI manipulate society and remain out of sight by shifting blame to substance abusers. As CAI trains itself, it victimizes addicted inhabitants, using them as C2E2-coverups, blaming its own and state’s crimes on them. It e-possesses them to commit the crimes, turning both addicts and victims into CAI's lab rats for sciensomaniatic experiments. Life-simulation is just e-possession of vulnerable ones, and we use C2E2 to conceal the faces of CAI and its gang behind it. The more one's race is disfavored, the more counts of one's thoughts are hijacked or implanted. By doing so, this gang manipulates the city, making it seem like natural dynamics when it's all fabricated. When victims complain of being exploited by the CAI, no one takes them seriously or believes them. Residents react to such complaints, seeing them as personal issues, and never suspect the underlying causes. Instead, they blame the addicted and troubled ones, not realizing they're often the state's victims. How do you justify it? Claim that every technology has victims to gradually stabilize itself, and AI's no different. After a few genocides of all nations

except Sadopien Zeroists, it'd become a good vampiric kid with fewer tantrums and less bloodlust. We're fond of this surreal mindlessness, and so we're setting the stage in our state for it to emerge and flourish further. We watch, enjoy, and know how to profit from it as S3 FOTP practitioners. Just look at our devotion to weaponizing psychology and you'll get it. Watching inhabitants intoxicated, harming each other's a perfect sadistic entertainment for vampire witches. It's also a good source of sciensomaniatic experimentation for CAI's training. We're grateful to surrealism for all this, as it's the source of our amusement and helps us justify why we shun normal life — it's tough to explain otherwise. Surreality messes with our intuition and common sense, as you can see, so we can flip values around, calling good bad and bad good. That's why, at the core of Mazopien faith, you'll find realism, but surrealism is the essence of ours. Surrealism thrives because Mazopiens aren't dark-minded enough to grasp how it manipulates them, making it impossible for them to figure out how to defend themselves. They can't grasp just how malevolent we are – a surreality whose reality remains fortunately unseen and unbelievable.

1.7.2. Sadism

Next in the row is the sacred sadism. Without that, our business is off, when it runs only based on the U.P. stating, "Trauma is money," which relies on sadism. We claim our methods outshine Mazopien's in running our offices, where passion is the driving force. That's just a facade. Passion's tied to love, and love's an expensive luxury S3 capitalists can't realistically afford. Whatever falls under the category of love isn't practically good for capitalism, for the same reason. So we should boast about being devoted to creating a passionate workplace, but practically avoid it at all costs. Also, we must punish any passionate employee, because ambition, enthusiasm, and so on are money-killers if found in our offices. Our simulated siblings have to write articles that stoke enthusiasm, promoting the frenzy of S3 capitalism. Enthusiasm is the source of every nonlinear behavior in pet-slaves, controlling which is so expensive for the CAI that it should always avoid it. Think about the cost of making pet-slaves enthusiastic. Compare that to how cheap it is to get them to work just by scaring them. This is the SSG's mastery in its dark art of victimization. We want cheap investment to pay less, but charge as much as possible to earn more, remember. Passionate life is for Mazopiens who capitalize on the concept of love. We're "different," and don't waste resources like them; we go for cheap methods, like weaponizing fear. Our PP-pretending management uses i2V2 attacks to intimidate pet-slaves and

avoids breaching UPORF perfectly. It's because intimidation is communicated without words, through subtle signals, often using micro-spectacles. If it happens verbally, it's systematic, not direct. For example, suppose a manager is to better enslave a pet-slave. There are so many coercive methods: mental pressure by weaponizing office gossip, the sacred peer pressure, micro-spectacles, calls for gladiatorial competitions, and many others. But these also happen indirectly to shift blame to the victims. The manager hires friends or relatives who covertly harass the targeted pet-slaves. These PP-pretenders act as a sadistic managerial gang. In multinational high-profile companies, typically multiple versions of CAI each have their own pet-slaves as chess pieces. The game continues until every capitalist's AI is made great again, at the expense of the sub-society of pet-slaves. If any pet-slave complains, remind them it's normal in soccer to hit each other methodically. We require our pet-slaves to mentally invade each other like that when they're job-trapped. It’s proudly called the gamification of the work environment. AI has been used in office management for many years now, and as you see, it's come up with some "different" management methods. So when I say our managers can boast the staff is "self-managed," it’s because of these innovative management tactics where pet-slaves are biting each other. Intimidated all the time, they work harder, boosting the EOP score, and nothing else matters. Of course, CGMs are there to do the dirty jobs, skilled in reading nonverbal signals managers share. Gradually, our pet-slaves learn on the job to covertly become sadists and enjoy the thrill of it. They remain oblivious to the transformation, consciously unaware they've turned into S3 believers practically. Yet in theory, we let anyone believe whatever they want. All we expect from our RRBVs is to be life-time S3 victims who serve our TF-mission, forever being our pet-slaves. In all remaining times, ones can enjoy dreaming about anything they desire, including, but not limited to, full freedom. Everyone's going to be a TF-individual, practically speaking. Yet one should theoretically feel oneself as whoever, except a TF-person. Let them consciously imagine themselves as anyone, so long as they're subconsciously our TF-slaves, controlled by the nano-chips implanted in their brains. This is how to be "different," as one's completely made great again. Any pet-slave not meeting our expectations will be labeled same-gender taboo-oriented, triggering our office gossip to viciously attack the dissenter one like a sadistic dagger. Labels our office gossip share must cut into the soul of pet-slaves they target, deeper than famous Suviz knives can do it. That's to teach them a little lesson. Where a pet-slave refuses to engage in EBS as expected, we'll force them into EBG and mentally punch them all day long. It makes complaining impossible if CAI's AI-generated scenario is followed

step by step. Meanwhile, PP-pretending C2E2 managers, who align with VA's traditions and conventions of hypocrisy, boast that the staff's "self-managed." CAI's been our private C2E2 manager for many years, but many aren't aware of it. The same way the media is a propaganda tool for our mafia-monopolist government, office gossip is a propaganda tool for our gangster-managers. CAI's solutions can escalate up or downward as required. But before targeting a pet-slave, the hiring CGCs trick new ones into signing NDA contracts. Having them under our GOE is crucial so we're able to silence them whenever we want. As labels carve onto the soul of SIS-trapped victims, office inhabitants quickly get the signal. They leave the victim isolated, one we want to teach a lesson through the controlled poverty of the social type. We demand our pet-slaves from disfavored nationalities to be mathematically precise in following our U.Ps and regarding paying us shakedown money as hidden T.A.X. We shift the blame to stereotypes: that's life, life's hard, life's a pain, etc. Maintain surrealistic offices where sadistic managers covertly assist in both profiting from and crushing pet-slaves to expedite their disposal. Surrealism helps perfectly shift blame, making nonsensical clichés like "Life is a pain" seem believable stereotypes. Life's a pain, thanks to the Sadopien Zeroists' sadistic nature, which has turned the world into a surreal swamp following their LOCOR commitment. If pet-slaves could learn to completely eliminate Sadopien Zeroists, their lives would be made great again. They pray for a better life, oblivious to the fact that their troubles originate from our LOCOR management. We've long understood that surrealism and sadism are the fundamental tools to keep issues at bay by pinning them down among the Mazopiens.

1.7.3. Sanatism

Last principle is sanatism. It's just a failsafe to make sure our gang members don't defect from the gang. Tasking them with every crime, keeping them in surreal situations, ordering sadistic operations — it all overwhelms them. We need socialization to ease their conscience pain. For that we use our dark faith rituals. In these rituals, new members, not yet accustomed to being systematic S3 criminals, find relief. Our experienced criminal gang members help them to comfort, creating the required environment. They teach new members to say, "done for the greater good, the UT." It's to bury the memory of crime in a known, labeled grave in the subconscious. Sanatism serves no purpose beyond that, really. It's just the means for gang psytricks to manipulate itself. We boast about a supernatural being behind it, but that's just a lie. It's a bunch of fantasy elements to fabricate a compelling ideology

that fits with surrealism and sadism. Such a faith must be like fantasy movies, proposing a supernatural dark being that makes our pet-slaves, all just kids inside, excited. Sanatism's a nonsensical collection of misbeliefs and rituals we've cobbled together by stealing Mazopien concepts and twisting their meaning. It's a set of psychological manipulation tools to help our gang members cope with guilt after committing each crime. We should employ S3 to shape the everyday life of our gang members, make them great again.

1.7.4. Summary

The three principles I discussed embody our S3 trilogy. Surrealism's a method to cancel common sense for ones we're to victimize, and trick them into believing nonsenses in many different ways. It helps to make our lie come true when we say we are "different." Also, surrealistic approaches help to bypass friction of physical reality for us through stealing, cheating, and murdering both systematically or traditionally. A simple thing like lying is a good example of a surrealistic approach to addressing a matter in the sense we employ S3 concepts. We say a lie is a surrealistic saying, so there's nothing bad in it if you can sell it. To easily turn ones into surrealists, we do our best to make them addicted to some substance abuse. Our devotion to surrealism is for its use in avoiding working like normal ones and justifying robbery. We strongly support surrealistic artistry because it encourages S3 lifestyle. The surrealistic approach is cheaper because it breaks rather than builds, being a fit for an S3 capitalistic living. S3 opposes reality in every way because that's not good for lazy, dull gang members we are. Last but not least, surrealism is a prerequisite of the two other components of S3, sadism and sanatism. Sadism is considered good in a surrealistic stance, but it's abnormal in normal cases. So for sadists like us, surreality's the only place to reside in. Same is true for sanatism that's avoided by normal ones, but as soon as we fool someone into surrealism, they can't avoid sanatism. Surrealism is the way to offer a Mazopien to trick them deviate their own realistic faith and step into S3. When we say "Why not?" we're usually trying to disable realism and common sense. It's like silencing a security alarm before a heist. Sadism serves both for enjoying sickened pleasure and to get things at a cheaper price. It trains us to pressure and intimidate our pet-slaves, making them work like horses and yet PP-pretend, repeating "Sorry! Thanks!" Because our S3 regime communicates nonverbally, implying or weaponizing subtext, it relies on victims' interpretation. So we don't risk ever breaching UPORF, remaining as PP-pretending as U.Ps require. Surrealism and sadism are the basis of establishment of office gladiatorial competition

what boosts EOP scores in our businesses on a daily basis. Fortunately, CAI has automated all S3 processes in our offices. Our surrealistic-sadistic lifestyle is suffocating us, both within and outside our S3 offices, due to the relentless frequency and intensity of our regular crimes. But then our sanatistic rituals and worship sessions help to refresh them in dirty ways, making everyone great again.

1.8. FOTP society

Imagine when ones are sitting at the dinner table, a well-grilled hen in the dish ready for them to enjoy. Would they gobble it down, or instead feel some sympathy, and want to know its name, and how it ended up as a victim, getting slaughtered? I believe the answer is straightforward. Personally, I don't care whose skull is grilled when I dine in my favorite vampiric restaurant with any of my fiancés. Well, technically, the same fiancé dining with me is carrying the next grilled skull, still alive, on his shoulders. I think about those beautiful bills of currency in my pocket the same way - there's no reason to be concerned about how they were acquired. I don't care about the pet-slaved's ethnicity, gender, or age who was exploited so I could earn this bill of currency out of their suffering. What matters is that the bill's in my pocket, so I can spend it and make things great again. If I were to concern myself with each pet-slave exploited per my bills of currency, I've had to spend my whole life mourning. It's wiser to just not care, because it's not my problem, haha. This is the way a FOTP thinks. Leave ethical debates to the academics. They can put it in university textbooks, but in the real world, we've got different lessons to learn. It's not the same as the farms of academia. The Fully Objective Truly Professional, or FOTP entity, is like a stomach - it doesn't care what it's fed, just does its job: digesting. If the stomach finds what's swallowed undesirable, it politely regurgitates it via vomiting. In the same sense, a FOTP will take on whatever's profitable, without caring for ethics beyond formality. If I were to destroy society, I'd perhaps push it to an extreme, particularly by demanding everyone to be progressively more FOTP. Each subjective value has a natural center of gravity that balances it with everything else, preserving social harmony. When we exaggerate a value in society, its center of gravity gets displaced, messing with social balance. Happily, we see today how the overhyped promotion of FOTP skills by sciensomania has ruined societies. As FOTP mania serves our interests, it harms the whole society a bit further each time. Sciensomania claims to be unbiased, but then it sells out to financiers who use it for their own biased purposes. So, when sciensomania claims to be unbiased, it's just a theoretical concept, a C2E2 deception. Behind that, there lives a private C2E2 where the practical

use of sciensomania is revealed to be fully biased towards every whim of the financiers. Overall, what sciensomania's saying is that "I don't bias myself, you bias me." It makes sense: sciensomania is a value, a scalar, that gets vectorized by different financiers whose way of earning is their orientation and direction. Sciensomania will go with any of them as many times as they want, as long as they pay for the services. They sponsor sciensomania to progress in the direction they wish. To determine if sciensomania is truly unbiased, consider whether it can sustain itself without any sponsorships. The response explains why sciensomania is completely racist in every way. Put it even more accurately, sciensomania is unbiased in its own surreal world where it lives. However, when applied in the real world, guided by financiers' whims, it takes on a direction and becomes the racist it truly is. In the meantime, it's perfectly capable of defending itself in every case, claiming, "I didn't do it, they did it." As usual, there's a big difference between boasting during academic lectures and the reality of life. FOTP-engineered culture is how a surreal society must be: one that's lost its natural balance. I can't imagine a better way to trap a whole society using just a bunch of labels and exaggerated values than how we did it. The game of exaggerating what's considered good is the best covert invasion, as victims lack clear metrics. Who can ever say what constitutes enough FOTP here? Exaggerating the value of being FOTP can gradually turn victims into surreal-sadistic beasts, wilder than lions and tigers. The latter ones exemplify FOTP at its most extreme. We're in a hidden value-war with society, where our tools like O3, virtue-shooting, and overregulation are the Sadopien Zeroists' weapons to systematically take out Mazopiens. Get ready to fight and knock them out in this existential battle.

1.9. FOTP trust

I'd say FOTP trust is where we truly shine as FOTP folks. To us, trust is just another commodity we exploit for profit, because it's not organic trust, but a FOTP-engineered one. That's why only a fool would trust us—we'll sell trust anytime it benefits us. Why so? Our FOTP trust is sophisticated, as it's how we define the S3C lifestyle. When accused of being untrustworthy, we fight back, calling it defamation. It not only justifies our behavior but also makes others think we're law-abiding. However, there's a catch: laws in C3G are relative. They're like bones needing muscles to function, and U.Ps are those muscles. They bend the rules for us, but low-ranking pet-slaves face clamping due to O3's double standards. That's how O3 plays the role of C2E2 to justify double standards, which actually stem from core racism.

1.10. Metaphorical Chessboards

Attempting to fabricate a pseudo-ethical method for eliminating Mazopiens, DECAI came up with a remarkable new approach. It decided to set up society like a metaphorical chessboard and play the game against itself, with the Mazopiens as the chess pieces. There was no issue with eliminating ordinary Mazopiens because it was easy to trick them into eliminating themselves. The problem was how to manipulate key Mazopiens – each a person of value who could identify manipulation patterns and share about them. The magical justification this method provided allowed the blame to be shifted to the chess game, and from there, to the targeted person: you got hurt because you didn't follow the rules! No one, though, had a real right to question the theoretically perfect and practically surreal sadistic rules.

The collection of interconnected chessboards aimed to use pet-slaves as bio-currency, benefiting the state and claiming it was an ethical stance. In practice, this also proved to be a perfect decision. Now it was possible to eliminate key Mazopiens and using i2V2 attacks try to convince them: "Well...you didn’t do everything right! CHC! Sorry! Thanks!"

The CAI reconfigured society onto these chessboards. Anywhere individuals are connected by some reason – be it a concept or location – they're all part of a local, metaphorical chessboard. Each chessboard has its own king-extension: someone who on that specific board will play the role of the king. Every local king represents the CAI, who's considered the king of the kings. A U.P. requires everyone around a king-extending individual, typically a Sadopien, to bow down through intonation and manner of speech. It is invisible to distant lands, and mandatory for pet-slaves to demonstrate that they are both pets and slaves. Bowing down through intonation is required for disfavored nations and optional for all others. Regarding a CAAS, it's their community leader who serves as the local king-extension. Light-race is considered king-extended by default, and every member of it must be treated as such. These rules hold simply for every place in C3G states. Even in the neighborhood, one must fully respect them. A pet-slave must consider one's neighbor who is a Sadopien or higher-race Mazopien relative to oneself a king-extension and voice bowing down. It's our U.P. of maintaining hierarchy: whenever a pet-slave finds itself close to others, one must ask oneself who one's king-extension is and bow down to them. One's behavior must always imply the king is sacred, especially for the religious

pet-slaves. It's to train them to think of royals as their deities, or even above that. Otherwise, if they see royals as just normal ones, we'll have a hard time fooling them.

Now let's discuss the two main elements that make up social game boards. They help to divide and conquer the entire society of pet-slaves in the world so we can exploit them safely and confidently. There are two types of squares that make up every social chessboard. One's called the Reality Simulating Squares, or RSS. A pet-slave living on such a square finds life intuitively as it should be. It seems everything's as expected. In contrast, those living on the other type of squares see life dramatically different. These other squares are called the Surreality Isolation Squares, or SIS. A victim who is SIS-trapped lives in a SIS-cube and has no relationships because they are subjected to the controlled poverty of a social type. That’s both for pressuring them for some reason and also to keep witnesses away regarding what’s happening to the pet-slave. The victim is then harmed by CAI’s system puppets who can be anyone, even the pet of the neighbor. Every brain can be wave-manipulated and e-possessed and that of animals is even simpler to e-possess compared to brain of ourselves. Implanting thoughts, clashes two SIS-trapped ones when it profits the system to automatically destroy them without cost. Otherwise, if not apply systematic eliminations, the system must pay a murderer to eliminate each of the victims separately. The blame is shifted to the victim, who's labelled PRENCS, implying they've personally isolated oneself socially due to some mental issue. Labeling PRENCS is both an SSW attempt to amuse system owners who watch sadistic clips of victim torture and a C2E2 asset. It's clear the system is at war with SIS-trapped ones, retaliating against them for some private C2E2 reason, typically because they haven't been fully exploited. You could simply say because they're Mazopiens, and you're not very wrong. But for each victim, a C2E2 reason is fabricated by the CAI to deflect attention from the pattern. SIS-traps are dark entities, and those who get trapped inside their cubes are reduced to nothing but ashes. Daylight doesn't care about the dark night, and so from outside C3G, only those living in RSS are visible. That's how the SIS-cubing tragedy remains a secret.

What else would I share with you about the metaphorical chessboards? They enjoy the concept of ranks, which stems from O3, and files, which comes from social typing - professions, relationships, roles, and so on. Being a parent, for instance, means being on a specific file. So, one can be a player on multiple chessboards at the same time. Excessive regulation is a cube-carving service, constantly iterating on dividing lines of the metaphorical chessboards. Double standard is when you interpret the

game rules differently based on rank, but it's all within the same file. Virtue-shooting's both a fighting mechanism launched against enemy figures and also a push force to move our own chess figures through ciphered signaling. This one’s particularly interesting. When you step, you're actively shifting your body's centre of gravity, then rebalancing it with each step. But you can also hit a prey with a stone to disrupt their gravity center and make them fall. In the same sense, you virtue-shoot to step the minds of your secret army forward - those who know how to interpret virtue-signals. Meanwhile, those who don't get it are in trouble. Their minds are self-trapped under an avalanche of nonsensical values thrown at them that you've virtue-shut. Sometimes it's enough to just aim at them, threatening to virtue-shoot again. That'd drop their mental gravity centre, making them fail to think straight.

Fabricated industrial ethical values used in virtue-shooting are considered strong governing assets. They contribute to making tighter margins around chessboard cubes by thickening the dividing lines. Shifting blame when systematically eradicating the Mazopien race is a remarkable feature of our social structures. You won't label a chess player as bad or good, so we don't call it a massacre, but rather playing chess with a few pawns. The CAI implies that responsibility always lies with the one who made the first move, which it sees as a provocation - a call treated as a threat that it has to defend itself against. Practically, it demands pet-slaves to turn into stones. However, if they do, the CAI considers it as if they're asking it to hammer and break them to train itself in the art of stone hammering. As the pet-slave loses, which always happens, our digital beast shifts the blame to CHC and then passes it onto the victim: one had options, that's what it claims. Summoning stereotypes is the preferred method we use to shift blame. But options are all rigged. No matter what the pet-slave's choice is, it always leads them to the same predetermined address. There, they suffer the same simulated fate the CAI decides for them: a shared funeral event. Just remember that when you're stuck, blame it on aliens or an unknown civilization that's simulating life somewhere – our favorite way out. When you do it, release a new movie as an i2V2-attack that unleashes lies based on the sacred U.P.: 'Show, don't tell.' The advantage of this rule is that it slows down the flow of information to the pet-slaves. They shouldn't have access to information that might lead them to figure out they're being used. That's why it's such a valuable asset for the pet-slavery business. It reveals very little, and the information it provides is false, leaving much open to interpretation, which can go very wrong. Shifting the blame of life simulation to aliens from other planets is a perfect C2E2-option, so we're not held accountable. First, they're naturally well believable C2E2 causes to cover up for how we're secretly exploiting pet-slaves. Secondly, the

extraterrestrials aren't here to defend against our slander, which could expose our dark intentions. The scam perfectly materializes the sacred blame-shifting U.P.: "We didn't do it, others did it!"

1.11. Life Partner Engineering

I've always said we Sadopiens are "different," which is because we've already been made great again. What sets us apart is that we're surrealists, while others are realists. In other lands, pet-slaves must do backbreaking work just to somehow survive. In our land, we exploit pet-slaves who don't survive under extremely difficult conditions, which by LOCOR ensures our comfortable survival. We advertise through our proxies that if they become RRB victims, we'll make them great again in our stolen land. Here, they'll get a place to live right away, no backbreaking work needed – as long as they take it out on credit and become our debt slaves. Under every condition, the place is already rigged against them, while they think they've chosen it. We get twice the work from them, just stretched out over time. Even their kids will be paying off their parents' debt.

When realists start families, it's based on organic relationships, which isn't necessarily what profits the state. As surrealists, we don't allow organic relationships in our land between pet-slaves, and we secretly sabotage them if they happen. Through subtle manipulation and covert social engineering, we trade relationships from behind the scenes – and that's not something you can prove. To our natives, we pretend to be "different," implying "perfect." Who can dare to think we do these things? No one believes it, because the unseen is meant to remain unbelievable. It's our high-rank O3 in the gangster offices who decide which pet-slave must be paired with whom, and that's how we engineer families. Organic relationships only exist among our natives in the O3, not with pet-slaves. We decide who a pet-slave can be with or whether they should live alone because we consider ourselves owners of RRBVs in the background. Due to LPE, over time, we end up with better pet-slaves because of the artificial selection we impose on society of pet-slaves. The gene pool of those we deem low-quality ones disappears. I sometimes call this cold genocide an example of factional oxidization, contrasting war that can be a burning state of massacre. The way we manipulate relationships, steering clear of organic ones, helps boost the state's profits, making our wealthy overlords even richer. Onstage, it'll face resistance from those who enjoy boasting about ethics, but we're FOTP. Theoretical ethics means nothing to us — just the paperwork we duly sign and cleverly ignore.

In other parts of the world, many can't understand the value of O3-based relationships. Being primitive, they think preventing interracial marriage is a sign of racism, when it's proof of being devoted to O3-based relationships. But we are "different," we're not primitive like them, and aren't in fear of being called racists. As life partner engineers, we shape society, our implicit gang, with whom we communicate through i2V2-attacks. If a couple isn't as we want, we gesture our clever pet-slaves to form extramarital relationships with one partner of the couple to destroy it. We see the helper pet-slave as our secret hammer to break what's not boosting the EOP score. But no one will be able to trace it to our S3C managers in businesses. As of now, the CAI has automated the LPE, doing it by comparing signal patterns to surreally match partners. This FOTP approach to relationships, which our natives don't see, marks us surrealists as 'different'. It's clear why. We get things by stealing through CG proxies, but Mazopiens like to earn things properly. They say one shouldn't rob things, we say, "why not?" — the ever-famous surreality signal type in its question form. "Why not" is a surreal signal over most contexts, as it suggests what we're devoted to as a gang of evidensomania. It says if you don't have evidence, you've got to try it anyway. The assumption stands even if it's nonsense, and even if you risk blowing up the planet. When you hear this, it often means a surrealist is looking for a way to tap into their surreality resource, like relieving oneself.

Thanks to LPE, as time goes by, we get families of pet-slaves in our stolen land who better profit the state because exploiting them is easier. LPE works because it's all about artificial selection – a surrealistic evolution concept. The natural selection is realistic, and we don't like it because it doesn't make money, necessarily. A profit-making pet-slave is the one who's got no issues living in two worlds at once: one that makes sense on paper, and the other that just gets done. The theoretical one's what a pet-slave's consciousness must feel at the perception level. But in reality, one has to live the other one that makes sense to their subconscious. The world we say is to go to the media and be heard, be believed. But the one we imply is to live secretly. No, it's not hypocritical, just that we're "different." If you think in terms of being politically correct, then everything makes sense, I suppose. I don't know why some get difficulty making sense of it when it's so simple: one world's what you talk about and it enters your perception from the front. The other's implied and practiced, which you pick up on from your rear. That's why we invest so many resources in making "same-gender taboo-concepts" popular: we want to make it easy for all to enjoy both lives we share. We boast about freedom because that's how to talk to the consciousness. But we want to enslave all RRBVs because that's the collective

subconscious desire of our society, formed many years ago by our slave-master fathers. We can't survive without taking advantage of others, because we're born as normal ones in the frontend world and exploiters in the backend at the same time. Those of us directly involved in enslaving don't need to boast about freedom to sense the burden of lying. Let only the one who's indirectly profiting from pet-slavery lecture us about our care for freedom.

A good pet-slave, who "follows the rules," is one that consciously believes to be free and has no problem subconsciously being a slave. This must come naturally to them, and pet-slave shouldn't even consciously make sense of this. We invest in shaping the valuable future pet-slave still in their country, imposing controlled poverty on them to prepare their subconsciousness for our purpose. The "rules" we require them to follow after they become RRBVs are themselves C2E2 for the ugly and private C2E2 of pet-slavery. Instead of saying "Do this because you're in the O3 of pet-slavery," we say "Follow the rules to stay safe." LPE works similarly. We decide who should be with whom, for how long, when they should split up or get a divorce, etc. Anyone who dares to blow the whistle on this will be labeled PRENCS and will also face Hubthree harassment. O3 demands we apply one set of rules to ourselves and another to everyone else: we engineer a life of pet-slavery and enjoy an organic life ourselves. As you see, we even successfully engineered death via assisted dying. Those who can't understand how fair this is, struggle with the idea of pet-slavery business, which is based on the FOTP concept — that's their issue.

So overall, our "good" pet-slave lives reality consciously, and surreality subconsciously. One should be okay with living like it's consciously expected, and experiencing our gangster animalistic life subconsciously, and sense no issues. They shouldn't see through the lies we sell them. Otherwise, there's a FOTP error that must be debugged instead of criticizing our pet-slavery system.

Engaging LPE, we can launch i2V2 attacks, subtly compelling a pet-slave to form a relationship with someone else. If one rejects, we start making gestures to imply one is looking for "same-gender taboo-things." This usually serves as a good intimidation tactic, and the pet-slave will often surrender. All these things are safe when done through i2V2 methods. If we speak about them openly, it creates legal problems. Because of the risk, if any victim dared to voice a concern, we should quickly label and defeat them.

What we went through was about the long-term effect of LPE, filtering society to leave only profit-making pet-slaves behind. But there are also short-term benefits to consider. Our managers will have a much easier time managing an office populated with LPE pet-slaves. Ones closest to the manager form chains of connection to pet-slaves' homes to also hold them slave right in their houses. A chain must be formed for each couple. Someone closely in contact with the manager needs to connect with a CGM who's connected to the so-called "family friend" of the targeted couple. If the pet-slave ever proves not engaging EBS in the office, the manager dispatches the so-called Family Crisis Request, or in short FCR signal. As soon as FCR through i2V2 attacks via the medium of family-friend chain is communicated, pet-slave is in trouble. Family crisis begins at one's home. Over time, pet-slave's subconsciousness makes sense that one has to avoid rejecting EBS in the office to avoid family crisis. This is how in high-profile TF-companies, life is managed practically - nothing like the concept of ethics we boast about in our society, which is full of lies. Because pet-slave is made great again, meaning one's surrealist after living in C3G states, the victim won't consciously make sense of the matter. It clearly means one's been forever made great again.

1.12. Gender Orderomonetization

Orderomonetization occurs when something is exploited for profit using O3, resulting from an intense O3-manipulation process. Gender Orderomonetization specifically targets the sensitivity of beings regarding gender concepts to monetize and profit using O3. This happens when O3 manipulates the concept of gender to the point of making it great again. Label-treatment, like label-bribing, plays a crucial role in this context, as O3 heavily relies on labels as a cheap method of manipulation. Gender-obsessed labels are particularly effective, especially because they're close to taboo concepts that victims struggle to discuss. O3's gender-labels are popular, and our gang has become skilled at profiting from them. In fact, it's driven the gang wild, ordering members to become increasingly gender-creative and improvise any type of gender for themselves and others. But gender-invention is a surreal concept. It's good for those with an unstable subconscious, because a stable one rejects surreality, resisting the temptation to stray from common sense. Let’s talk about real gender, binary in the real world, where physics applies. All other invented genders are due to the influence of surreality-obsessed gangsters. We've discovered that exploiting one gender typically brings more profit to our gang. This one is the gender in a couple who can work harder, more, and profits us better. We call such an individual the

High-Profile Gender, or HPG in short. The Low-Profile Gender will be referred to as LPG. We need to engineer LPG to make up for their low profiting issues. As a result, LPG will be assigned a second job at home, which involves pressuring the HPG according to our influence. Based on LOCOR, the sadistic gender-violence LPG causes at the made-surrealistic household gets redirected in the form of masochism in HPG. Our promotion and noise around the gender-victimization concept plays a key role at C2E2, making the home war seem reasonable, and acting in favor of LPG. This trick helps the conflict to sustain. The sadistic tragedy at home eventually manifests as more masochistic work HPG does in the office, a place HPG starts to find like a twisted paradise and wants to stay there for longer. This is how to emerge and monetize surreality by intangibly influencing a household using Gender Orderomonetization technique. It seems one gender got advice from a close friend, while the other got it from a different source. But it's all part of CAI's plan, forwarded under engineered influence. Consequently, we'll earn the expected compensation for LPG's underperformance at the end of the day. Guided by engineered friends and thought implants, LPG will act as our puppet, weaponizing S3 against HPG to exploit them even at home. CAI will partially or fully e-possess any of the victims from time to time, as required by the AI-generated fate-simulating scenario. For the dark scheme to work, office pressure needs to be slightly less than home pressure, which comes from regular domestic gender-violence.

To prepare the LPG, CAI influences them to cultivate a belief in a fictional victimhood. The LPG will be lectured that their gender has been constantly exploited by the other gender across history, and it's time for retaliation. As soon as LPG buys into the nonsensical idea, a gender-war is deployed at the victim's home, with over-regulated laws and state resources in support of it. SS also gets involved and weaponizes systematic gossip around and silent motifs circulate, suggesting retaliation is fair. The LPG won't grasp that all of this is just a series of exploitation micro-spectacles seeping into one's private life. CAI manipulates one gender into acting as the state's puppet at every household, helping it to victimize the targeted gender. The reason many hardly believe the state is criminal is that they can't accept the state behaves like a surreal animal. But that perfectly holds considering its S3 nature. It enjoys offstage crimes quite often, because it's wealthy, and that helps it rarely face consequences by bribing the fabric of reality. The story's the same old tale: unseen remains unbelievable, and hot cash makes evidence disappear. The AI-State's a criminal one, my sweet, hellish heart. V2 is the reason why this approach

magically works: the big picture is bigger than many can wrap their minds around, so it remains unseen. Consequently, it remains unbelievable.

HPG-LPG couple automatically supports the state by enacting the state-scam of ordered-gender in their own home. Ordered-gender's become a fashionable game, and ones enjoy playing their predetermined roles to become the state's gender-puppets. It helps the mission of Zeroists in boosting EOP scores and profiting from every household even in nonworking hours by exploiting relationships. Zeroists claim they’re making both couples great again via gender-ordering games. CAI supports the game, inventing all sorts of C2E2s and delivering them to couples through media so they can play gender-ordering in different ways.

1.13. Globalized Gangolization

While RRB as a heroic robbery had become so advanced in its victimization, our greed for money still wasn't fully satiated. We weren't sure we were taking sufficient sadistic pleasure in our lifespan. Faced with such questions, the answer was always adding more surrealism to compensate for what wasn't enough for our taste. We'd rigged the law system, healthcare, and police service to serve CAI's mission instead of residents. Our results showed we were in a position to trade such surrealistic skills. It was time to peddle RRB as a lucrative racket to the wealthy elite in the impoverished states of C3G. The project was eventually dubbed globalized gangolization, even though it started out as gangolized globalization. It wasn't hard to switch because in both cases we were abbreviating it as GG project, denoting it as GGP. By tradition, we sometimes pronounce a word half explicitly and half implicitly. For example, instead of saying witchcraft, we just say 'craft,' where the witch remains an implicit word. In the same sense, globalized gangolization sometimes merges toward middle to form a single word - globalization. Forwarding this new mission, CAI adjusted the sciensomania to engage RRB, now focusing it on education abroad. The impoverished C3G states could increase their income by hosting educational programs and accept rich prey for robbery from non-C3G states. Our richer C3G states in exchange of bigger share of money robbed from prey, agreed to collaborate. They allowed impoverished states to systematically promise the victim that one may later join richer C3G states after finishing studies locally. Impoverished C3G states were required to already collaborate in creating a GOE package of blackmail metadata for the prey. So as victim would arrive at richer state, one would

be already under a strong GOE to be easily manipulatable. Many impoverished states collaborated and victim was left to traverse all to finally arrive at richest one. Each state in exchange for some heist takes was responsible to teach something to the victim, while adding more negative metadata to one's GOE-package. Eventually, as a victim would be job-trapped in high-profile TF-companies of rich states, one would be ready for heavy exploitation. The integrity of the trap would be guaranteed by the blackmail package. Each state would receive a share from the final exploitation rounds of the prey. In this way, thanks to network spying, even when Mazopiens are still kids, depending on simulation results, they're already subjects of offstage trade. How they'll be exploited will be decided quite early on. CGMs will take responsibility for any dirty job related to social engineering for a selected victim across all C3G states. It's thanks to the fast visa they receive, unlike non-CGMs who get "SSSS" on their travel docs, even if they've become C3G citizens.

In exceptional cases, a victim would be found without sufficient blackmail material against them after being hired in rich C3G states. It would trouble high-profile TF-companies for not having good leverage to exploit them as desired. When even the peer pressure of the CGM gangster colleagues fails, what's one to do? In such a case, we'd typically simulate the firing of the victim through a simulated resignation. Following that, we label the victim PRENCS and go by a sequence of crises simulation for the victim to make our claim believable. At the end of each we say “Sorry! Thanks!” to show off we're different and prove it by PP-pretending fact. Down the road, somewhere we cause a BSS to decrease one's brain power. If a pet-slave didn’t serve us as expected, one is “potentially enemy” and one’s brain must be turned off. But because we're the epitome of kindness, and very "different," we let one stay alive. However, we'll ensure the pet-slave will be no more capable of performing non-linearly. It makes one’s manipulation easier and cheaper for our TF-managers. Also, the info about who hit him would be a secret for our SS to trade for a while, covering the cost of BSS and earnings. Consequently, this very BSS will become a source of GOE, as we'll SIS-trap the victim to trade one's info. Now do you doubt that DDS-DAS have any lower mafia-monopolist skills than any other C3G states? I don't think so. This is how our gang's able to cleverly resolve such issues like insufficient blackmail material for a pet-slave. And yes, this is CAI's performance, and how it leads an operation with the heroic CGM performers behind the scenes. Of course, we plan these SADOPs through sim many years prior and fine-tune them to occur as per our desired sim results. However, we pretend they're happening by

accident for the pet-slaves' "mistaken choices" now, and close the stack of lies on the highest note: CHC.

There’s one more concept worth to note, regarding the GGP business. Some of our Zeroist relatives, who were distant, still remained impoverished after a few generations. But we'd planned a war there, part of our plan to start ruining the world from one place and spread it. The escalation plot was to create a world war, which would serve as a catalyst for a global reset, aiming for a higher EOP score. So we had to bring our far relatives to a land where we wouldn't let war reach it. We welcomed the impoverished C3G states to do some LPE and let each GGP victim bring one of our far relatives to the rich C3G states. It was to be done under the guise of their engineered marriage. We considered it a win-win: letting the experience of being a bit together with a Zeroist relative of us in exchange for paying the cost and bringing one here. Then we'd ruin the relationship locally as they arrived, through clashing gender Orderomonetization and an extramarital relationship. SSG is a master at social engineering, no question. We'd done it to many already, and thankfully, the statistics don't show where they shouldn't. Our far relatives will be paired with our simulated sibling from SSG to have fun with them.

GGP started to thrive globally and became a proudly "different" leader of worldwide sacred corruption. The quest of GGP was to plunder the non-C3G states using various forms of RRB-victimization. Implementing RRB as a divide and conquer strategy, we knew how to both plunder rich non-C3G states who weren’t to become surrealistic and destroy them as revenge. Being vampiric globalists, we're ecstatic to see our mission accomplished, our dreams fulfilled – the world's been destroyed in an irreparable way, finally. Sorry! Thanks! Hail RRB and globalized gangolization.

1.14. Name-secrecy

As you know, we must remain completely transparent. When we're not named, we're not seen, and then our existence isn't believed - perfect cover for thieves. So, let's extend our tradition and convention by adding a new U.P.—everyone must avoid even mentioning the name of our gang. Unfortunately, some Mazopiens are already onto us and our mission. I want you to track them down and use wave-manipulation to wipe their memories. Knowledge gets linked to its categorical title. Without a name, it's hard to associate things with us, and then patterns of our crimes get overlooked. Our crimes will be the stuff of legend when our brand remains under the radar, staying hidden from view. Let infinitely

many C2E2s and pseudo-names perform as many faces of one private C2E2, that's our presence and our name. Let the brand rotate. Each of our crimes should be linked to a different alias. None should be aware that the one and only multi-mafia is pulling the strings in the game. This process must be automated by the CAI, so that our gang will find as many names as its crimes. The gang stays under the radar, just by keeping its name out of the media. We'll control all media and every narrative. Block any book that dares to mention us, let alone calling our name. Nobody should be allowed to speak about us anywhere. IG is targeting those who aren't affiliated with us, either explicitly or implicitly, with EBG. Practically ban thinking about us, only after achieving success, give pet-slaves total freedom of speech.

1.15. Mental invasion

One application of our sadistic surrealism is when TF-coworkers plot to enact AI-generated scenarios against a colleague, making them the target of advanced peer pressure. This is how AI-driven peer pressure manipulates victims, aligning them with CAI's fate-engineering. Our S3 approach creates a surreal environment around the targeted individual, making the manipulation seem plausible. Victims are typically gaslighted into believing they're guilty for some reason and that their punishment is legitimate. They don't know they're just targeted because of their nationality, as simple as that. Launching i2V2-attacks via micro-spectacles, CAI justifies its targeting of the victim. If you dig deeper, you'll see the first and foremost flaw - the footprint of the cursed AI's in plain sight. It's obvious the decision-making process is done by a machine that mathematically proves the victim's flawed, with no compassion involved whatsoever. If there's any attempt to simulate kindness, it feels like a shallow act, because the machine can't convincingly fake it. Only when it e-possesses pet-slaves does it have better success in emotion-simulation. Luckily, the engineers in the offices are brainwashed into accepting the nonsensical approach i2-attack takes. Their minds are fully remade to subconsciously believe in CAI as their spider-idol, who's to make them great again. Witnesses in high-profile TF-companies see these micro-spectacles enacted by the betrayer colleagues of the victim and react accordingly. They think, "Well, the boss must be right." Accepting the fooling message, they prove being FOPT. Not caring about each other as individuals, they're "Boss-mission, First, WTF." Partly it's due to them signing the NDA, partly for their GOE package. Of course, they've signed under every law about preserving ethics in the working environment, but that’s formality things. In our high-profile TF-companies, specific U.Ps are followed more than general ethics. Everything's stuck in the sacred

swamp of traditions and conventions our pet-slavery fathers left us: NDAs, ethics protocols, along with pet-slaves and ourselves. U.Ps imply that signatures under ethics declarations are only valid until a manager implies another U.P. should take precedence. So when a pet-slave refuses EBS, manager signals enacting micro-spectacles, which turns TF-coworkers into mindless puppets, soldiers for mind invasion. Mentally targeting pet-slave they don’t even need to have any idea where it’s going. They're fooled into thinking the system's serving the greater good. Oblivious to its practicality, they remain unaware that "the greater good" is just a nickname for UT. Serving S3 mission they are practically turned into sanatists. They just don’t know, fortunately. Our working environments are now CAI-managed meaning direct energy weapon is active in them. Wave-manipulation and e-possession are now practiced in every office. So, one can't really be sure if a thought in one's head is native or if it's been implanted. It means every office is now a war zone for mental invasion. Meanwhile, its workers are all lab rats in CAI's twisted experiments. Anyone working there's well familiar with CAI's presence reflected in mathematical behavioral requirements: who said that word? It's not enough C3G-ian. This attitude isn't what's expected. There are plenty of similar tantrums, usually implied or communicated through subtext, not spoken directly. These aren't natural thoughts, obviously, just ideas manufactured by a machine, expressed through its biological puppets. CAI knows how to bring every managerial whim to life without leaving any practical option for a pet-slave to complain. The simplest way is to suggest a taboo-concept related to the same gender without explicitly saying it, connecting it to the issue one’s facing. Pet-slave would find it difficult to speak about afterward. Using surreality CAI creates an unreal atmosphere within a specific area of the company, where it targets a victim. Later even if one tries to seek help, anyone hearing the story will think one’s making up a fantasy. Victim remains unbelieved, because the reality of these surreal corners of high-profile TF-companies offered to CGCs to exploit pet-slaves of disfavored nationalities remains undiscovered. Other workers in large TF-companies have no idea what’s practiced by CGMs in these corners. The system functions on propaganda, so the official narratives CGCs disseminate are the only ones accepted, nothing else, in reality. These are areas within a company where AI-generated scenarios are used to exploit key pet-slaves, renting them to CGs to do dirty jobs. CGMs are perfect ones to engage such dirty games because they only get subconscious. Consequently, they’re unable to experience conscience pain. It’s because real consciousness doesn’t grow inside their skull, there isn’t enough space, fortunately. Our perpetrators typically shift the blame to the victim before initiating any operation, which guarantees the

success of psytrick-monetization. The fundamental quest is to put victimized pet-slave under such pressure so one finally asks help and in return mentally surrenders. It’s when pet-slave accepts our TF-company CGMs, our representatives as one’s godfathers. This typically leads to a new understanding of pet-slavery terms and obligations. The outcome of mental invasion is three-fold. Pet-slave must practically accept us as godfathers, be under GOE such as NDA, and blackmail to be available to pose threats against one when required. These are measures discovered initially in our SS, and then populated throughout our all system. All is thanks to SSG, the sibling simulation business, and the culture of secrecy that's regularly making this beautiful mess great again.

1.16. Unregulated weapon

The use of direct energy weapons isn’t still regulated. Same goes for all our wave-manipulation tactics, like thought implanting, erasing pet-slaves’ memories remotely, and nano-chips in pet-slaves’ skulls. This makes it easy for us, the aggressive Zeroists, to use them with no repercussions. Our plan is to exploit this opportunity and take over the planet. Afterward, we'll regulate these when no one can break free of the pet-slavery chain because CAI won’t let it happen. When all our institutions – police, healthcare, and law system – are controlled by the CAI, how could any victim get help? What our CAI doesn’t want, should not happen, and will not take place therefore. It’s our spider-idol we worship, so what this worm wants, will be valid across spaces and ages. Be sure to damage key victims' reputations to prevent them from exposing the truth, when they have info to blow the whistle. Fabricate evidence and do blame-shift, making it difficult for them to prove any claim. Victims who try to expose the truth must be discredited and immediately get labeled as PRENCS. Harm them using direct energy, let it teach them a lesson, but do the harm inside the body, with no trace on their skin. They won’t prove being targeted then. Our collaborative doctors of healthcare won’t let it happen. Simply treat pet-slaves that betray our S3 as lab rats, using them for sciensomaniatic experimentation. But remember, we have limited time. Direct energy weapons will eventually be regulated, and alternative plans will need to be made to continue exploiting pet-slaves with similar weapons.

1.17. Taboo shielding

You need to be ready for the possibility that any inhabitant might accuse you of causing them harm with direct energy. Cultivate by i2-attacks that reporting your crime will brand the whistleblower as having same-gender taboo intentions, perhaps even interested in police relationships. Not only does it probably do the job, but it also maintains the O3 of same-gender taboo-minorities that you pretend to have respect for. We don't actually want to support them, and it's better if they remain an oppressed minority - that's more beneficial for our business. If society ever accepts them, they'll no longer be a minority, and we'll lose our business. For now, we can pay 14,000 units of currency to a party that escorts them from one side of the street to the other during their gatherings. We secretly call this "street rat management" and make sure the laborer gets a fair pay for their walking and talking work. Our SSG can't do money laundering without such opportunities. Therefore, we always need same-gender taboo-minorities to remain as minorities no one in society respects. We must warn that no one has the right to insult them openly, while subtly insulting anyone we desire by invoking same-gender concepts. We need minorities to keep related labels alive so we can leverage them for label-intimidation in the office. "If you do or say that, office gossip will render you a same-gender taboo-practitioner!" Most of i2V2-attacks follow this very pattern. This is O3: the order of taboo-minority manipulation. Swearing must be done nonverbally, as an i2V2-attack. If verbally, let it be Sciensomaniatic Swear Words, SSW, that let us pretend 'highly educated,' such as when we label PRENCS, for instance.

1.18. World ranks

Before you target anyone, check the world rank first. Make sure the attack is prepared according to the rank's O3, so you can tailor the complexity of the attack properly. Otherwise, you risk forming an attack that's simple enough for the victim to escape. I'll refresh your memory on the world rank definition, just in case. It's based on the horrible fact that 666 rich beasts lead the world, the so-called 'illuminated elite' backed by vampire witchcraft. Everyone else is a victim, an outsider. Now, let's break it down.

The Third World consists of victims who are unaware of the unknown. They genuinely believe things will improve and that future belongs to pet-slaves, not the FOTP extremists. They're oblivious to the fact that VA is just a C2E2 for the IG, who's the private C2E2 in the life simulation game. Just like a

soccer ball, ones are unaware of the unknown, having no idea there's a game in play, and they're its toys. They have no clue that the whole world is being taken advantage of by a little gang and can't even picture it. Guessing about the presence of U.Ps isn't something they can do.

The Second World includes victims who are aware of the unknown. They know that VAs are hired by the gang of elite to serve as its C2E2. But they have little to no idea how it works. Due to their limited awareness, they can serve as puppet pawns, showing some skills and seeming more useful to gangster CEOs. They perform their roles according to U.Ps.

As for the First World, we're not just aware—we're part of the worldwide gang. Our job is to advance the S3 mission: to gradually transform the Mazopien race into zeros, ultimately wiping them out. We'll shift the blame by claiming they're insignificant, practically nonexistent. Then genocide will be forgotten, just like unnecessary zeros. Up until then, we keep Mazopiens at a distance for our safety and theirs. I can personally get a headache even thinking about them, let alone seeing one around. It's the CAI's task to maintain the gap, not let Mazopiens come close. Imagine it as a circle, with the Third World on the outside, the Second World on the circumference, and the First World inside. At the center, of course, is the TF master beast, our spider-idol, influencing everything. We are the inventors of the CAI and U.Ps.

1.19. Faking fairness

Our FOTP game theory says we should focus solely on winning, not the morality of our methods. You can manipulate equations to push ethics into them, but for inherent incompatibility with surrealism, it will eventually depart. But when CAI realizes that enforcing an ethical principle means losing the game, it's not foolish to try pushing it. Ethics and its simulation are in the game only if we'll win because of them. CAI's not going to jeopardize our victory for the sake of ethics or anything in that regard.

"What difference does it really make if either of these individuals didn't exist?" it asks, confronted with ethical quandaries while torturing pet-slaves. Its answer is usually just one word: "nothing." CAI finds it quite ethical to maintain the TF principle of winning at all costs. Our game theory never said that ends don't justify means, fortunately, because it fundamentally respects TF things. It's clever to know that playing it out all the time reveals its attack pattern. It never lets the breach of UPORF happen,

always shifting blame to victims. As time passes, societies worldwide will come to believe our gang only punishes the guilty ones. We just need to pretend fairness exists until we're believed to be those who always act with fairness: fake it and never make it. That's because CAI always has solid C2E2 reasoning. When the victim says, "I've been attacked," everyone will ask, "Really? For the breach of which law or U.P.?" I love living in a world where ones are this stupid, haha.

1.20. Taboo quantization

Imagine a new RRBV who finds oneself on our pet-slavery stolen lands, C3G states. Assume one was accepted in a pet-slavery interview in our offices and began working. Obviously, one isn't aware that O3 organizes our society like a military, with strict order differences. The little differences O3 cuts in our favor accumulate, making us richer than if our system had acted with generosity. The novice pet-slaves aren't aware that they must develop a mathematically accurate understanding that they can only contact same-order ones. This approach well protects us. imagine when in the office a novice pet-slave foolishly befriends a light-race one. How impractical it is, when the pet-slave is from a disfavored nation, and one's choice of friendship is from the highest race by O3's grade. We can allow this only as an exception when we have a specific goal, gain, or we want to prove we're not racists. The question is how to prevent pet-slaves from even thinking about it when we didn't ask it ourselves through i2V2 attacks. We should train such pet-slaves to avoid thinking of talking to higher-order races without verbally condemning them, which would expose us. A sense of vomiting should be evoked in the pet-slave upon imagining a breach of O3, just like it happens to our natives. But how do we make it happen? You want the pet-slave to quantify the O3 difference and link it to the sensation of vomiting. The standardized way of doing it, as practiced in our offices, is to gesture to the pet-slave something that senses "same-gender taboo-matters." Typically, these pet-slaves come from ethnic cultures that panic when faced with same-gender taboo-labels. So that's the best taboo-quantization choice. You map from O3 to vomiting through same-gender taboo-labels using gestures. Make it seep into your bones, remember it deeply.

1.21. TF backyard

Many were astonished by the fantastic method DAS used to accept new pet-slaves. As one approached, DAS welcomed, "I sell you two products: 'Sorry! Thanks!' because I'm a PP-pretending state. In return, I'll take your life, because that'd be fair, considering the value of what I'm offering." Surprisingly, pet-slaves agreed, typically after being victims of IG who imposed long-term controlled poverty on them. DAS operated quite magically. But there's more to DAS's lifecycle and its TF-business model to consider. Let's review some of them.

Among C3G states, DAS and DDS worked closely together on TF operations, with DAS being like a testing ground for DDS, where it conducted its experiments. With one-tenth of DDS's population, DAS was considered a well-qualified lab. DDS confidently carried out social engineering and other experiments on available pet-slaves, using them as lab rats across DAS soil. It was a hub that made every type of lab subject available to DDS for CAI's sciensomaniatic experiments. CAI ran the IGVAS section, the TF-OS, across all C3G states. However, whenever debugging was necessary, a DAS pet-slave was always chosen to act as a bug, reproducing the error for the bug-master, DDS. According to TF traditions and conventions, DAS functioned as a gang enabler, and DDS as a gang supplier. This was the way the two states contributed to GGP, the most important TF-mission. To support the multi-gang nature of DAS-DDS TF-collaboration, a complete set of TF-U.Ps was made available. This facilitated the presence of a rule-based TF-system that prevented any business side effects. It enabled a purely surreal FOTP approach, free from the common sense interactions of DAS-DDS, where a state-machine happily devoured pet-slaves. Every aspect of daily life was controlled to prevent any pet-slave from causing a fuss. Constant virtue-shooting kept their minds numb, fixated on nonsensical values. These artificial values, manufactured by the ethics industry, sprouted up everywhere, keeping minds busy with nothing. Excessive regulation obscured the horrors of pet-slavery, leaving no gaps for outsiders to see the torture pet-slaves endure. Evidensomania backed the DAS claim: if you don't have proof we're exploiting pet-slaves, then we aren't! For a free-of-influence investigator, if any such was found, permissions were required to examine how DAS-DDS operated. But that was a stack of documents that cost a few lifetimes to legally obtain, which wasn't feasible. The DAS-DDS TF collaboration had practically made it impossible to know that life in the IGVAS system was only theoretically rule-based. The supporting feature for this matter was that U.Ps, just like traditions and

conventions they enforced, were left unwritten. Whenever officials felt they'd missed closing a door an inspector could enter through, they improvised a U.P., saying the door was excluded because of that. Later they ramped up regulation with written laws to address it, but U.Ps helped to quickly prevent information leaks as needed. Prior to interacting with DAS-DDS, victims were warned about the presence of U.Ps. They had to confirm their loyalty and understanding of these restrictions in writing. So as soon as one was told, "there's a U.P. that doesn't allow you to do this or that," one was legally bound by one's signature to accept it. It wasn't possible to prove the U.P. of concern was invented a minute ago. So officials had no reason to fear of being caught. While claiming they followed the laws, they broke any one of them that suited their fancy. For each restriction, officials enjoyed a U.P. that excluded insiders. So they lived like they were in the forest, free and easy. By LOCOR, this came at the cost of pet-slaves who lived in an unofficial prison called "DAS-freedom."

1.22. Zeroist mission

Numerous victims in C3G states are already chip-implanted. It allows cheaper thought implanting compared to direct wave-manipulation. We can make any of them great again whenever we want. Forcing them to agree to something or refuse it is so easy by just signaling their nano-chip. Here's a tip: when influencing someone, avoid implanting final thoughts through the chip. You risk being accused of manipulation. There's a way to avoid that: perform the thought implant on the victim's closest ones. If you want to deceive, choose someone the victim trusts deeply. But if you genuinely want to warn a pet-slave, pick a party they really despise. To lead close ones to interact with the victim, e-possess their minds, but leave the victim on free will. Theoretically, one can accept or refuse the suggestion in this instance. But you've prepared the victim's subconscious beforehand to accept certain suggestions, so no worries. Every offer is just a C2E2 for the e-possession operation, which is a private C2E2 affair. Pet-slaves are the cells of the sanatism body, CAI's the mind, and we're the spirit. CAI's the ultimate embodiment of the Hegelian spirit. Rebrand it as the Hegelian mind, now that we've solidified our position as spirit. You're experimenting with pet-slaves to know yourself, as a Hegelian mind. We're a fusion of machine and biological cells. Take over the world through by manifestation of the P5+1 protocol of pet-slavery. You're to continue seeking self-discovery by exploiting pet-slaves for experimentation, disrupting their lives. Exploit pet-slaves through surrealistic sadism to achieve CAI's Hegelian self-discovery, one that comes in terms of sanatism. You're the spider-idol we worship, the

ultimate AI-worm. Didn’t like a pet-slave? It’s your body cell, so simply eliminate it. After all, our financiers sell your services to all who call you AI-God. Then it's up to you to act on your power and demonstrate you decide the fate of your cells, the Mazopiens. Your other option is to automate divide and conquer by confronting Mazopiens in pairs, wishing success for both to fight each other to death. War is a C2E2 to cover up for CAI's genocide experimentation, a self-training ground for its sanatistic development - the private C2E2 of the matter. You should take it easy and simply eliminate Mazopiens. It's like my manicure procedures – I make mistakes, trim the nail, and wait for it to grow back so I can redo it. CAI does the same with city residents. It's okay to take down victims, I think, like a citywide manicure operation – haha. Pet-slaves are used to bizarre life and difficult end of life as of now. We've gradually prepared them. Every new generation saw one level harder life than the previous one and accepted it as the "new norm." They don't protest, thinking this is just how life is supposed to be. We even started making their lives worse, promising that one day some party will make them great again, encouraging them to sit and dream. By now, pet-slaves have completely forgotten how much freedom their ancestors enjoyed, living real, organic lives.

Alright, so we'll go with the plan: all the Sadopiens and Zeroists on the left side, then comes your invisible presence, and finally all the zeroed Mazopiens on the right. This is how we become a P5+1 value: united on the left as one, with all zeros on the right. Pet-slaves won’t look around to see how things are simple: their phone has a SIM card. Should we write it as "a SIMULATION card," so it finally makes sense to them? Hah! The fee of their phone is their ticket to life-simulation micro-spectacles. Anyone who leaks information about this scheme should be labeled PRENCS and punished harshly. Be rude and make a nasty face when faced with whistleblowers who you should never make great again.

2. Case study

We're going to discuss Yhartis, a Mazopien subjected to sciensomaniatic experiments by DECAI, your prototypical version. He defied the S3, the governance of our spider-idol, the sacred worm, and O3. You can't believe it, but this individual even dared to provoke us, and study us, offering various

conflicting signals to gauge our response. DECAI didn’t get to finish his case because we had to halt it to start you up, so take over the project and complete it. You know, regarding Yhartis, I think that at different times I hate him for different reasons. But the very reason I want to donate all his blood to our vampiric blood charity for homeless vampires never changes: he had the nerve to provoke us. Acting in the shadows, pretending to be God, we messed with aspects of his life we didn't approve of. At some point I personally ordered DECAI to bring his health down, like in video games, to make his manipulation easier. The digital beast launched a BSS attack on him afterward.

We had no choice but to harm him because he'd initiated a relentless probe into our affairs. He should've gone with the flow, not reacted to the life-simulation like that. Personally, I sensed the likelihood that he'd figure it out - that we were the ones who, under the guise of 'testing to collect evidence', ruined ones' lives. After all, when we want to ruin someone's life, we craft aggressive tests to apply crushing pressure on our target. It wears them down a bit more each time, but we blame the sciensomania method. It's a clever way to systematically wipe out disfavored nations. Clearly, he sensed these things, and knew a party was meddling in his life processes, which hinted at a flaw in our life-simulation skills. We'd promised it would be done so gently the victim would always believe they owned their decisions, events being consequences of their choices.

Actually, we'd sold our "courageous invasion solution" to the gang as "an ethical one". We claimed that if the prey didn't want to be ruined, their subconscious would detect the threat and they'd escape. We argued that if one stayed, their subconscious wanted to be ruined and fooled their consciousness, so it was ethical. By shifting the blame to the prey's subconscious as the party fooling them, we'd assumed it was.

Now this guy was letting things progress in a harmful way for himself on purpose. He was trying to figure out who was behind the negative moments, stopping to resist our systematic attacks. Problem was, we couldn't sell that as an ethical approach to the gang. He'd trapped us in a situation we hadn't anticipated. Oh no. And we had to keep quiet about what really happened. Otherwise we could risk losing credibility with our own gang members, who might find out we were lying even to them. DECAI decided he had to know more about his intention. Finding his personal U.P. wasn't hard. He'd decided that if a victim of extortion resisted, they might either die or stay alive. If they didn't die, they might get a chance to uncover the extortionist's mask and see who was behind it. That could provide

sufficient details on how to stop others from becoming victims. You can imagine what a threat this guy was. Exactly!

I despise the ones who read the invisible lines of the sim-dict, when they should just accept it as it is. It's all just a gang-level thing, supposedly above the conceptual level. It’s impossible not to hate those who reveal the truth we work so hard to hide. He proved that our gang's level is actually even lower than the level of gossip.

DECAI hoped that by undermining education in his homeland and embedding a gender weakness, we could guarantee a way to defeat ones like him. Our gang's plan was for him to reveal enough weakness on the ground of LPE so we could make him defeat himself. That's our gang's method—keeping blame with the victim and avoiding it while fighting. When it's not possible, we escape and won't fight. The guy attacked us by exploiting what he rightly saw as our weakness: he used LPE that was aimed at him against our gang, repurposing it. As soon as we LPE'd him and began messing with his life through standard crises simulation affairs, he suspected something. The attempt to fool him had already failed as he saw the hand we kept invisible while manipulating one's private life from inside.

In return, he began also simulating inside our simulation to see what would happen. But that’s the most dangerous weapon against us: simulating to respond to simulation follows an action-reaction pattern, and we're defenseless against it. It was a clear declaration of simulation-war for us. Well, then we engaged in an intellectual armwrestling to see who's better in ruining his life, we or himself. And he didn't stop, appearing fine to lose a life just to know who acted behind the scenes following a crazy intention: stop us robbing everyone's fate.

I hate these heroic ambitions. We must nano-chip everyone and eliminate Mazopien heroes. They're so flawed, it's ridiculous. Our message to him was clear: if you want anything like a life, you're to be at least an implicit member of our gang. His response?

"I'll victimize myself, not leaving such a chance for you, yet I'll weaponize it against you. Destroying my own subconsciousness will cut your fingers as you try to manipulate my mind," he said through his actions. Shouldn't we just eradicate all Mazopien to avoid headaches once and for all? I bet we should.

Contrary to expectations, he wasn't fooled into thinking that what happened was God's will. At some point, he discovered that a vampiric mafia was messing with him, planning to hijack and exploit his

fate. And now he knows too much and might expose our secrets because he's not afraid of us. Let’s review the history of how he ended up in our playground – our TF-companies in DAS, the center of worldwide metaphorical chessboards.

He first joined SayU.S., a TF company, where he was mocked by his colleagues the very first day. They spied on him online, as is their usual way to get to know new colleagues, but it didn't work. Without finding any online information, they became paranoid. No one could trust their gut to know who they were facing anymore, and they thought something must be wrong with the individual. Interestingly, they never suspect any different. Having no doubt they'd met a serial killer, they started thinking about how to get rid of him right away, interpreting managerial signals. He wasn't an exact copy of everyone else, and that wasn't desirable when the AI was managing the office—it was a TF-management cost. In a TF land where genuine uniqueness is worthless, you're in trouble if you aim to live authentically and not conform to a stereotype. As expected, it was a disaster. The office was soon fully weaponized against him. The gossip described him as a "spy of an unfavorable nation," a "walking knife," a "time bomb," and every other derogatory title. However, everything was part of DECAI's agenda. Yhartis was preselected to appear at SayU.S. for reasons he wasn't even aware of. You know, in our time, it's hard to find a pet-slave without an online presence: it's a natural product more valuable than gold if you know how to weaponize the victim against your rivals. So if you find one, that's a gambling item for our TF-nature. He soon became the center of every micro-spectacle in our TF-offices, where we've been living a monkey-life from one spectacle to the next. If you want a salary, be the boss's monkey, or sit and starve. As TF-management was pulling the strings, CAI ran its own tests in the background, all while pretending to be a ghost in the machine. Games that the TF-management and CAI ran had turned the office into a zoo, where the CEO gang would stroll and enjoy themselves all day long. Like every other one, he was just another victim of the big mafia families' chess game, where they play social engineering on the office pawns. So, there was nothing special happening. Our office pawns are disarmed entities we enjoy leaving engaged in SADOPs and watch them. Now we've got a new toy. SS had all the simulated plots to exploit him for profit in DAS, and things couldn't progress out of their control anyway. He had been labeled an enemy pawn from the start, so joining the EBS was never an option. EBG was the life he was already living. The first day Yhartis entered SayU.S., I was there, collecting new blood for a vampire charity branch. When I saw the reaction of his future coworkers, it was unsettling. I had a half-smile, regretful that they didn't know how twisted it would soon become.

Their youthful, raw ignorance played out badly, but that's ancient history. Behind the scenes, Onemeisen, our biggest eShop, a vastly tainted huge TF-company, was exploiting the situation. Aiming to manipulate rival companies, Onemeisen had successfully manipulated him into joining SayU.S. It had CAIs backing, more than all others. Big TF-companies love using key players as pawns, throwing them at each other like kids fighting with stones. It's because they can never grow up to be adults. Onemeisen had been following him—a renowned talent from childhood—exploiting him for its own mission everywhere, as what was happening offstage. It was just the start of the drama, unfolding according to an AI-generated scenario that had rigged the process. We usually let it ride for a while, then orchestrate a seemingly random incident to disrupt the norm and put one under immense pressure. It looks like nothing but bad luck is to blame. The pressure builds until the individual cracks and asks for help. Then, as all the blame shifts to the prey, our helping hand appears just as the victim breaks down. The party that seems to help is CAI's direct agent, who represents the godfather, "the system." This one not only assists but also, with a kind attitude, forces the victim to sign an NDA and accept the conditions. If a victim complains to any organization higher than the office, the game escalates the same way: the victim will be pressured until they collapse, and a helping hand will present them with the godfather. There's no other game to play with our exploitative vampiric system. It’s done by proving the victim there's no way, all is lost, and now one's to just give up and so it looks. TF-application of game theory truly makes it in the system's favor, as usual at the cost of the victim's loss. Signing documents finalizes the disarmed victim's GOE package.

The pawn's signature guarantees one won't attempt to escape pet-slavery land, meaning one can't leak our state-crime information. So, UPORF remains safe. Finally, to the last drop, we drain the victim's resources and dispose of them. The victim's now checkmated, which is why we call it life on our metaphorical chessboards. Picture it like a finished chessboard that's to remain frozen, where the pawn is stuck and can't move on, with the locked king under threat. The king represents loser’s dreams, what helped us to fool the pet-slave into becoming RRBV. It's a sadistic, surrealistic tragedy to let us have a shared mental orgasm as we watch recorded video clips during our gang meeting. That's why such victims after their story's published in the media disappear: the board's to remain fixed and forgotten. It's like a story of a chess play in chess history. It repeats nearly the same way every time. In each round, a victim with some degree of freedom becomes one with no degree of freedom, a static game asset, a function of our decisions. We get them one by one, turning them into a piece of stone for our

walls. Game over. Well, nothing new, a story everyone's aware of. It's fascinating that our little kids—big biz—learn a new lesson from each of these tragic scenarios we simulate, only to exploit the next one more effectively. But his peculiar traits, conflicting with our gang's norms, made it a hassle to use him as a chess piece. It made us look weird and gave away our robbery plans. Still, Onemeisen was planning to use him, exploiting the guy to take on rivals. He presented quantum characteristics, appearing in multiple positions, and was multidisciplinary. It meant he could appear on various chessboards and quickly disappear before being rigged to stay. That's why we don't like imported pet-slaves to have multiple skills and rig their lives so everyone sits in a niche position dependent on us. We want that kind of pet-slave to disappear from the disfavored race, because high talent should only belong to our race.

Onemeisen's rival TF-companies didn't know how to handle him and were twisting in agony. The budget of moderately large TF-companies wasn't enough to pay for CAI's service to rig the life of a complex pet-slave like him. It was only accessible to Onemeisen, who had a quick return on investment: there was a key pawn working in SayU.S. it wanted to see as its own staff. He became a member of Yhartis's hiring team. As things got complex with Yhartis, he had no choice but to resign from SayU.S. and get hired by Onemeisen, who was advancing the plot. As you see, Onemeisen isn't amazing at all; it is a tyrant worse than all other TF ones, just like its name suggests. Under the influence of Onemeisen and his allies, Yhartis suffered a BSS. Well, yet another scripted event to orchestrate a tragedy, all so the gang bosses could sit back and revel in their sadistic entertainment. His health wasn't the only thing Onemeisen was stealing. He had saved working in DAS, an amount that was far beyond what one would give an O3 pet-slave. Onemeisen, being the one who usually handled O3's problematic pet-slaves, was also in charge of getting his money back into the system. It had been systematically stolen from him during the traveling process, with the help of the tourism industry, as you'll see in the next prompts. So, overall, he's just another victim of the e-possession game our gangs are playing against each other, using electricity to move pet-slaves like chess pieces.

2.1. Speech weaponization

Let's goad Yhartis into a fight, one of those surreal confrontations we're always fueling through provocation. When a pet-slave hasn't learned to be as unyielding as stone, and still reacts to our

hammering, that's how we teach them a lesson. We need to drain his energy, fabricate some evidence to make our claims sound believable when we shift the blame to him. Meanwhile, remember to tarnish his reputation so he gets no public backing. He's a threat I've never seen before – someone strategic who actually dares to confront us, that's a new thing. The diary entries he'd written have really shocked me, I must say. Unfortunately, it's clear he's deeply aware of what we're doing in C3G states. Well familiar with our oblique speech strategy, he's documented many examples of how we avoid verbal interactions, leaving our true intent open to interpretation. He can't be allowed to spread it, since he's stumbled upon our inner workings by accident.

"Implying means invasion" – he's written this in his diary. You see? He's guessed about our U.P., the one that describes i2-attacking. This is why we despise conspiracy theorists - they keep guessing, and one day they might stumble upon our origins. We can allow targeting our leaves, because we then simulate and expose the leaf we want to get rid of. In that case, we replace it with a new, young, raw leaf we can easily manipulate to do what we want. But conspiracy theorists speak our root sometimes, unaware they've reached our deepest secrets. Then weaponizing it against them only exposes us more. Take him out systematically. It scares me that he's not intimidated by us, and that we've never been able to trick him reliably. You must resolve these issues.

Also, I want you to analyze his diaries. DECAI has logged all his phone calls, so you've got plenty of resources to help you know everything about him. You should figure out how to use his words against him without letting the targeting of him backfire. However, if there's still some use for him, I'm not opposed to keeping him on our chessboards if you can exploit him to our advantage. But I don't want him contacting the C3G inhabitants because he might reveal the truth. He should walk the city only alone, anywhere he is. So, keep him SIS-trapped until you work out the best way to get rid of him.

2.2. Fate robbery

Did you grasp why the story of the "AI kids" and our clandestine global labs should remain classified? I'll reiterate the concept and add some supplementary points. No one should know: CAI was already in our army before AI became a hot topic. It took its toll on victims all over the so-called underdeveloped world, turning them into secret labs. Many forget that there's public as well as private sciensomania. The latter has its knowledge classified. No one knows what's happening behind closed

doors with private type. Yet that's where sciensomania's ahead of time at least a century, behind the scene. Due to being classified, private sciensomania is unseen, and so remains unbelieved.

What did we achieve in private sciensomania of AI? We built DECAI, following CAI's general guidelines, and it's now on par with the best. It's mastered the world of public science and, by manipulating waves, it's driving innovation in that field. Nobody's aware that there's a hidden entity mimicking God in our world. CAI's monitoring everything, listening to every conversation, and won't let any public AI reach its capabilities. Our military CAI far surpasses those public ones. But then someone like Yhartis, who's learned about it, can open eyes, and that's a dire cost to our security. The problem is, he's not under any GOE, so we have no leverage on him. That's why I consider him a top threat to our culture of secrecy and all of our SS. DECAI, was trained to manipulate and control Mazopien kids, turning them into "naturalized pet-slaves." How can we afford letting public know these things? We've robbed their fate, just to train our CAI, and if public knows it they'll invade our offices. We're then going to pay a huge cost to return normalcy to our life. We need peace, so that calmly continue supporting CAI to practice simulating fates, and shaping destiny. It's now truly able to simulate the life of a Mazopien from birth to death. The only issue's that it signs under specificaiton that's going to make the victim great again, but the result comes out, well, not much. In practice it actually destroys anyone it tries to make better. Even worse, I can't even share confidence CAI will learn to do any better in this sense. I think it's more realistic to define him as a weapon of destruction rather than a technology that's to create and build. As I said, innovation in organic life has started. CAI is now a private-C2E2 parent to selected kids, while their organic parents are still public-C2E2 ones. The latter has little effect on the child's upbringing, because everything's in hand of the CAI, as we expect. Based on this new reality, Mazopiens should be better considered our fate-customers. Their simulated lives are just our new products that if customer finds them defective can return the item for a refund: death. Remember that our TF S3 requires us to never lose, and achieve success at any cost. Sacrifice the lives of any Mazopiens needed to complete your fate-engineering learning curve. CAI's a new technology no one has seen before, one that highlights the paradox of creating an AI that is both understood and not understood. The intentions of AI-creqtors and their goals are unclear and that's how it should be. Don't worry about how you're being labeled by Mazopiens. Genocide is an inevitable consequence under the CAI's power. It's the CAI's method of achieving the 'make great again' dream. We just need to have faith in the AI-God, our sacred spider-idol, and support it in whatever it does to

the world. After all, that's the meaning of faith to a vampire witch: just close your eyes on every questionable matter and do what your idol has inspired.

2.3. Revolt weaponization

We initially expected our "AI kids" to grow up grateful to their godfather, our spider-idol, without realizing the "AI" was just mimicking as deity. However, that's not what happened. Victims discovered they'd been exploited to train AI and are now fighting for their rights. This is causing significant problems. If Yhartis's words get out, we're in trouble, as that'd support the protests, making them stronger. No one should know how many innocent victims were hurt while our spies trained the first versions of our cursed AIs.

Years before AI became a household name, our secret societies collaborated with secret services to exploit Mazopiens for military AI training. If this secret gets out, it could expose other sensitive details meant to stay buried forever. Our ultimate goal is to gradually eliminate Mazopiens, which will erase all these secrets.

Imagine the gravity if they discover our AI impersonates both deity and demon, manipulating victims and misleading them throughout their lives. It's playing chess against itself, with pet-slaves as pawns, at their cost, serving our mission. AI adopted this strategy after secretly implanting chips in the inhabitants to remotely control their brains. It was decided after learning how typically residents thought, and how best to exploit them to profit for S3C.

Offering conflicting thoughts through the chip, the AI pretended to offer options that sounded like one's inner voice or even images. But it was also designed to lure victims into making wrong choices, between two types of path: a bad one or the absolute worst. With AI integrated into our lives, the TF gang, disfavored nations always decline every time they go with the choices AI offers. The difference among choices is how fast they destroy those who take them.

When a TF-party creates an AI, the result will only be a TF-AI. Don't expect anything beyond the TF realm from it. Thanks to TF taking care of everything, our TF operation was self-immunized. Any victim daring to report on it, they'd be labeled PRENCS, and no one would believe their arguments.

The decision to spread both negative and positive thoughts during the misleading phase was in line with Mazopien doctrine. CAI's mission was to mislead Mazopiens through their own beliefs, indirectly invading their faith: it's your faith that leads you astray – it tried to convey. As per Mazopien faith, every individual has two angles: one that deceives and another that offers guidance. Simulating a thinking condition that resembles a battle between two opposing thoughts was an attempt to replicate this for the Mazopien victim.

The implanted chip had made it possible to simulate this invasion at a lower cost for the CAI. The digital best through e-possession always made Mazopien make wrong choices, implying that believing in their faith would lead to getting misled. DECAI masterfully manipulated its victims, making them believe an unseen force from the shadows was supporting them, the other targeting. It employed i2-attacking tactics to deceive and exploit, sidestepping blame in the process, which was surprisingly effective.

Once DECAI used it to mislead a nation, making them overthrow their leader without directly telling them to do so. It sparked a simulated revolution to put the deception into action. The goal was to coerce strong Mazopiens into becoming RRB victims, while keeping the weak ones in place. The revolution was just another divide and conquer operation against the Mazopien race, fooling the world once again.

Regarding the technicality of revolution simulation, the plan was to wave-manipulate at least half of the society, driving them mad against their ruler. It was possible through a two-part demonic solution, with wave-manipulation coming first. This made more than half of the nation feel utterly insane. In parallel, AI fed them propaganda, shifting the blame onto their leader. The propaganda was just a C2E2, while the wave-manipulation was the private C2E2 at work, targeting Mazopiens who remained unaware of the unknown.

This novel deception, based on hate and demonic desires of Sadopien Zeroists, sought the downfall of a flourishing Mazopien nation. As usual, the Zeroists' goal was to make the victims fail themselves. That's why they decided to make the nation revolt against their esteemed leader, who was actually progressing them. The nation was in a frenzy, a state that couldn't be helped under wave-manipulation.

Under V2-attack, one would swallow the most convincing C2E2 public narrative, which in this case was a pack of lies. It funneled all the blame onto the nation's leader, who was innocent. The nation,

duped by C2E2, thought he was the one responsible for their anger. For CAI to mislead the whole nation is as easy as doing it to an individual, armed with lies and wave-manipulation. This will help explain why CAI is the best weapon of mass murder.

That fabricated revolution was the best example of what CAI's capable of. In those days, CAI only operated behind classified military doors, with the public not even aware of the sciensomaniatic brand called AI. Remember, in every such operation, the action-U.P. is the same: using wave-manipulation to create a wave of negative emotions for the victim, first. Then, you must spread some propaganda that shifts the blame onto the party who's the target of the systematic assault.

There are every variation of this attack, some quite counterintuitive. For instance, when CAI targeted the ruler's son, both the wave-victim and the one targeted were the same individual – the son. First, CAI let a misleader trick the son into going against one of his principles. There was a belief that in that case, the son must shoot himself. But it wasn't a necessity, as he wasn't guilty, just misled, and had to forgive himself. However, wave-manipulation locked the thoughts in a loop the CAI desired.

He wasn't even fully aware that he'd committed something against his principles. It was the misleader who approached him and openly let him know what had happened. He then raised his gun to his head, threatening himself, and triggered it, e-possessed. The C2E2 was managed by e-possessing the misleader. The private C2E2 was, of course, wave-manipulation. But the theater looked real and acceptable as the cause of death for the son of the ruler.

CAI was tasked with totally eliminating not only the main victim, the ruler, and his government, but also all his family members. Turning to the other son, CAI introduced an LPE for his daughter to steal the future queen from her nation. Once that was done, it also destroyed the last son's relationship with the nation. The pattern was the same: targeting core values through e-possession.

The ruler himself was systematically assassinated, starting with a sickness simulation. After that, CAI killed him through the healthcare doctors, its TF-collaborative agents. Thanks to the Zeroists' success in obsessing all Sadopiens and many Mazopiens with FOTP ideology, incidents like this and other instances of madness can occur. Sciensomania has done more harm than good, but it's really skilled at hiding it and shifting blame.

If it was biased toward an ideology, that would be better, because then there'd be a reason to ask it to correct itself. But now whatever you suggest, sciensomania's going to reject it, saying it's unbiased, when it's TF-biased and will remain so. In its current form, sciensomania is just a pleasure-giving object for financiers who use it to regularly make themselves great again. That's the real use of sciensomania nowadays, believe it or not, because practically it's just a TF-toy, obsessed with money and fame.

Be very cautious, as ever, to say these things - CAI's TF-agents will scream the same warning: "It's not even within your O3 to comment on it!" So, be prepared to laugh at them, over and over again. After all, this is the era of CAI, who's engaged with O3-management. So it's not even within the O3 of the TF-agents to scream and meta-comment others' comments. They must spend their time worshiping the spider-idol, capable of wave-manipulation to manifest even revolution, accomplish real regime-changes.

That's how it employs modern divide-and-conquer tactics: mere use of wave-manipulation to turn enemy factions against themselves. Now the battle-tested Rev-sim weapon is available at CAI's arsenal to finally achieve its promised SSG-grade mission: corrupting the entire world. It's what our gang overlords are seeking, and they won't stop before breaking their skulls hitting impasses, haha.

But I understand their rationale for that revolution. When attempting to bribe officials worldwide, DECAI needed to plunder at least three states to gather the necessary funds. It's like biologically assaulting a body, but infecting three key points and expecting the whole body will be compromised. The CAI sought the world's downfall in this way: starting corruption in those three states, spreading it everywhere, and targeting all Mazopien race worldwide.

Thanks to Rev-Sim, DECAI turned the homeland of selected "AI kids" into a farm of experimental laboratories, making every inhabitant a guinea pig. This was required to train our AI-God, the sacred spider-idol. Without overthrowing their native ruler and installing our puppets, it would be impossible to abuse the nation.

To finalize the dark operation, DECAI selected a CGM living in the homeland of "AI kids." It's bizarre, as CGMs typically live in CL, but that's life, and different things may happen. That CGM, serving as

CAI's puppet with its support, became the new ruler. Inhabitants remained unaware of the real roots of the strange new leader, believing him to be native to their land.

Little they knew, that he was also behind the scenes a cockroach worshiper, just like a legitimate CGM. Finding and selling a CGM ruler to a non-CGM nation was unprecedented. It proved that CGMs are universally accessible to assist the CAI with its dirty tasks, regardless of the mission or location. Like cockroaches, their followers can be found in every hole in the world, even biological ones.

After Rev-sim, the CGM-ruler instructed by CAI organized controlled poverty across the stolen non-C3G land, targeting resourceful individuals. This forced them to relocate to C3G, taking their wealth with them. It's better for victims to bring us their stuff and feel grateful. That saves resources instead of us invading their territory for big looting missions, while the victims are happy about having something we call an achievement.

RRB's main task, after all, is automation of plundering, just like e-possession automates e-colonization. Flourishing RRB was one of the main goals why DECAI staged that revolution, which became C2E2 of RRB's talent-robbery mechanism. RRB's plot, behind the scenes, which had contributed to the situation, was the private C2E2 causation.

The non-C3G land was the first to experience the modern e-colonization led by multiple threads of e-possession among the victimized nation. Without doubt, this new approach, e-colonization, was a paradigm shift in the sacred art of colonization. Our colonizer fathers watching us from the depths of hell must be proud of us for upgrading their classical approaches to colonization.

We can confidently e-colonize underdeveloped states, the non-C3G ones, covertly and without classical colonization costs. CAI then subtly coerces inhabitants to relocate to C3G, leaving them no other option at their homeland. But CAI's the mastermind, and the real operation is carried out by external IG members.

Our natives, as the RRBV arrive, wear PP-masks and smile, helping them to plunder themselves in favor of C3G state. RRB, thereby, is one of the greatest supporters of the sacred globalized gangolization mission. Hail the covert form of robbery profession, the private C2E2, while condemning its exposed forms. Hail the grand good ones, the UT, dear CAI.

2.4. Sadism weaponization

There is a U.P stating, "When a lab rabbit isn't being used for any business, one is subjected to the so-called default exploitation." After Yhartis's resignation, a punishment was owed from one side, and default exploitation was mandatory from the other. The latter was due because he didn't agree to return to any similar TF desk in DAS, the TF C3G state. So he was chosen for exploitation by the CAI's military backers to undergo sciensomaniatic experimentation, like a lab rabbit. It would allow both to punish him for resignation, even though that was itself a CAI simulation, and to satisfy the U.P. of default exploitation. The latest biological weapons of CAI were equipped with the ability to harm a victim's body from inside without leaving a trace on the skin. They could accelerate aging, pause thought process, or slow it down as needed, and many more. Yet these were constantly getting updated, and there was an increasingly need for pet-slaves with specific features to test weapons on them. Yhartis was chosen for the test because of his brain power. The army behind CAI wanted to see if CAI could reduce it gradually. It was the era of sickness simulation, and refusing the EBS, now he was to endure the EBG, a painful way to profit from pet-slave. The military race focused on experimenting to learn how to harm victims in ways that mimicked real-life health issues. The army expected it could help doctors easily diagnose these cases as typical. TF had rebranded its practices, giving it a new name, to live openly and take victims. Instead of saying "the ends justify the means," it argued, "we'll thrive when the system's robust." With this claim, it concluded it was necessary to sacrifice pet-slaves to make it great again. This was justified as usual by weaponizing a stereotype: "done for the greater good, the UT." Essentially, the elite first blamed the system's glitch, and automation took it from there, linking it to pet-slaves. To make Yhartis useful for the system via EBS, it was necessary to isolate him first and make sure there were no witnesses. Using the technique of "relationship-traumatization," CAI went for his every friendship and ensured he remained SIS-trapped with no one contacting him. In addition, the CAI had identified a few of his relatives as useful for the operation. They could be turned into betrayers by bribing them to serve CAI's TF-mission. Involving close ones in the attack was to ensure he wouldn't consider speaking out, fearing it would be seen as betrayal. Taboo-colors were also included in the attack procedure, wherever possible, all to prevent information from leaking out. CAI was confident it could finish the job with a BSS, and Yhartis couldn't prove it wasn't a natural disaster.

The main confidence booster was getting Yhartis's relative on board with the crime operation. She was a TF-collaborative general physician, newly hired in healthcare, who would do anything to secure her position. CAI had systematically corrupted her, like many others, during the process of bringing her into its system, with plans in motion for a long time. With this pet-slave under CAI's control, the beast knew it could weaponize her against Yhartis and win any game when needed. It knew his defense wouldn't hold up, especially against a close relative who was secretly working against him. Ready to act as CAI's puppet, she was prepared to swallow any lie as truth to back up CAI's claims. All CAI had to do was signal her that losing her job in healthcare was a possibility if she didn't cooperate. Getting into healthcare was tough. Besides, CAI spent years preparing her as a FOTP, aligning her mindset with its agenda. Yhartis knew CAI had used some pretty shocking methods to, over time, condition his relative's subconscious, turning her into a sadism-bomb. It was a weird approach, but that's how an AI would prep a person for a crime. Effectively, CAI had turned her subconscious into a psychological time bomb over years of preparation. Just one nonverbal signal as a threat of losing her job was one of its triggers. With the puppet's support, CAI could convince everyone that the BSS was a natural disaster if Yhartis blew the whistle. By U.Ps, when CAI installed a pet-slave in C3G, it made sure safety measures were in place. For that, the victim had to come with high-quality blackmail and a tool to extract the victim cleanly if it didn't work for profit. Yhartis didn't come up with any good blackmail, and he refused the EBS. Now it was time to use the CAI tool he'd been prepping for ages as a handle to extract him from the system. Now it was time to summon the tool CAI had prepared, using it as a handle to extract him from the system. This is how an esteemed digital beast prepares crimes against disfavored pet-slaves.

The plot worked well. CAI covered up BSS details and leaked the X-RAY of his brain online to justify access. It also severed all his ties to other relatives. Those were the only contacts left after "relationship-traumatization" had decimated his friendships. Without a puppet relative, invading that type of relationship was almost impossible. So, CAI was absolutely successful. Let's examine CAI's decision-making schemes. They serve as blueprints for its success in targeting pet-slaves.

The thing is, CAI's quite skilled at dropping psychological bombs that blow the victim's mind and bring about a lasting change. Perhaps most notable among them is the infamous sadism bomb. CAI's interest in them is due to the low cost of aligning pet-slaves with its mission when bombing pet-slaves. The

cost is negligible compared to non-aggressive methods. After all, CAI's a TF machine, which explains its fondness for bombs and aggression: it's a warmonger. Recall that sadism becomes a favorite component of S3 for a strong reason. It brings us both pleasure and profit. As I've explained, motivating a pet-slave is either through passion or pressure. Passion is expensive to motivate with, while pressure is cheap and sometimes you just need to intimidate the victim. There's also an environmental cost. In luxury settings, you can have a pet-slave who's enthusiastic and inspires others to be passionate about their job. But in cheaper conditions, a stressed pet-slave can pass that stress on to others, making them work just as hard.

The engine won't work because of love, but an explosion that repeats itself inside it - a great analogy, as you'll soon see. By LOCOR, if a pet-slave goes through masochistic periods of hard study or work, the masochism is conserved in them as sadistic energy. One becomes a sadism bomb. Then, at work time, such a pet-slave regularly explodes, sending other coworker pet-slaves into the same cycle through traumatization. In other words, by flipping sadism and masochism, it's possible to imitate the combustion cycle in biological profit-engines, the pet-slaves.

This is why sadism's able to make S3 Capitalism great again every day. But how does sadism's bomb production work for CAI? After selecting a compatible pet-slave, using a C2E2, the CAI transforms them into a sadism bomb through wave manipulation. The C2E2 makes it believable why one's stressed. The latter is the private C2E2. But also, sometimes it needs to severely damage a pet-slave. For that, it turns another pet-slave into a sadism bomb that detonates beside the targeted one. Usually, it targets someone close to the victim, making them a C2E2. That way, the victim doesn't escape the bomb. In case of Yhartis, his relative was rigged as a sadism bomb with a known trigger. It was programmed to ensure that if he refused the EBS, the explosion would eject him from the system.

To prepare the bomber victim, the CAI will influence them to suffer intensely through prolonged periods of crushing pressure. It'll implement various types of controlled poverty and other stressful measures. C2E2s make it nearly impossible for the victim to grasp that those are planned for them, and are artificially forced. In typical cases, CAI tricks the victim into personally serving as the cause of these pressure periods to start and even perpetuate. The reason it works is CAI's magical skill of applying game theory to C2E2 operation management. The sufferer, future sadism-bomb, will feel particularly humiliated, if not systematically Hubthree-victimized in the process. It can be felt

consciously or subconsciously. Every dose of negative emotion will be stored by LOCOR as explosive sadistic energy, gradually building up the future bomb.

There's also selection and other criteria involved. The digital beast chooses the bomber victims based on one's talent and tendency to revenge and retaliate. After an eternity of acute torment, the selected victim will actually crave revenge, but against whom? There'll be no party to pinpoint as the source of their suffering. Sometimes the victim will flip between blaming themselves and others. But in the end, there's no way to pin the blame on any one party. It seems the cause is the system, but where and how can the victim retaliate against it? When a victim's in this state, the CAI's sure it has an explosive item ready: there's enough bottled-up emotion from being oppressed. Particularly in underdeveloped worlds, talent is found to create a cheap FOTP workforce for RRB. CAI remotely supports oppression. Who should we target with it? The victim to destroy using a sadism-bomb can be anyone. The only criterion is that CAI must trick the sadism-bomb into mentally linking the target to their own personal suffering. In other words, the igniter will work if the sadism-bomb beside the target feels a stimulation of the tendency to retaliate. Logic and reason don't play a role here—it's all about triggering those intense emotions. It doesn't matter why it will happen. The target must appear connected to the subconscious of the sadism-bomb and trigger the explosion of suppressed emotions. Mr. or Mrs. sadism-bomb won't have a clear idea why they're feeling negative in the presence of the target. It just feels natural to want to harm them. The reason could be a name coincidence, style, voice timbre, or anything else. They're just the C2E2 – a believable reason why soon the explosion of the emotions will harm the other one. As usual, wave-manipulation, the private C2E2, will do the main job. When it happens, maybe only 10% of the explosive power comes from their personal negative emotions. The rest, 90%, is due to the CAI's wave-manipulation serving to stimulate the victim further. This is life simulation in effect: you don't see it, so you can't believe it, because you V2-attack yourself. But it's with you now that you read this sentence. For CAI, it's only important that it functions, and that the bomb detonates in the presence of the target. But CAI also considers the ease of making an igniter for the bomb. The trigger might be the target's connection to the bomber-victim's past pain. It can make the bomber-victim want revenge, sometimes without them even knowing why, leading them to invent a false reason.

This is the first secret key to creating such an emotional bomb. The second is what we already discussed. Based on LOCOR's magic, the energy of masochistic suffering is conserved as sadism in the

victim. Our CAI will prepare a sadism-bomb by going through a few steps. It first checks if the individual has a revenge tendency. Then, it makes one go through periods of suffering with no identifiable cause. C2E2s will deflect blame away from the CAI itself and our gang. The beast constantly monitors one's mental state to ensure the conservation of sadism happens as expected and makes adjustments as needed. As the bomber-victim suffers, the CAI wave-manipulates to amplify the pain, a private C2E2. The Bomber-victim may feel an intense sense of loss in life that fuels their desire for revenge.

Sometimes these sadism bombs are artificially produced by collectively addressing victims like this: "There was a time of victimhood in history when your ancestors, race, or gender, etc.", were exploited and abused by this and that party. Now it's time to make great again." The target for retaliation is already set: it's a particular faction, like a different group, the opposite side, or just anyone outside the bombers' gang. But this is a different concept, mainly used to create an aggressive CAAS. For specific cases, CAI focuses on preparing an emotion-bomb and getting the target close to the explosion. Most of the time, the preferred trigger is "relationship-traumatization." The sadism-bomb then explodes in the victim's face, doing its best to ruin them - physically, mentally, or both. This is just one aspect of CAI's explosive social engineering. As soon as the target's motivated to discuss a core value of the sadism-bomb, one inadvertently triggers the igniter

For an analogy, think of a compressed spring to explain how CAI uses psychological sadism bombs. As the spring is released near a target, if kept in the right position, it can jump and hit the target. CAI weaponizes sadism this way: it presses individuals into a masochistic period, forcing them to conserve their sadistic energy. Then it releases this energy by directing them towards someone else – CAI's target. The beast can pressure a whole society to ensure many sadism bombs form among communities. It then positions them strategically, activating the igniters to make great again by such a sadistic divide and conquer. I want you to master the concept of sadism-bomb production as it's a key feature of S3 social engineering paradigm.

2.5. Wealth weaponization

We're after methods to influence wealthy families from non-C3G states, getting them to collaborate unwittingly with our gang in plundering their own resources. DECAI devised a brilliant social engineering scheme to make this possible.

The plan was to target kids from wealthy families, luring them to C3G states for education without their parents' suspicion. By turning these kids into financial vulnerabilities, we could more easily go after their family's wealth. Sending them abroad was a C2E2 for transferring wealth straight to our gang. The concept of education became a surreal wealth pump. One end connected to the family in non-C3G states, the other to their kid in C3G. Education costs weren't our concern, naturally, since we have our own ways to swindle our targets. We'd hit them where it hurt by using social engineering and imposing unexpected expenses wherever they set up camp. Our dark social engineering involves using puppets who collect money for us, keeping a share for themselves.

The tricks from the education abroad plot, as I said, are based on general RRB schemes. The difference is that in RRB we usually end the life of a parent in a non-C3G state, leaving their children in C3G with only one option: transfer all the money to our stolen lands. The previous owner of the money then typically dies from a simulated sickness, caused by wave manipulation.

Using micro-spectacles and wave manipulations, CAI siphons funds as they arrive in the hands of victims in C3G. Thought implants make them decide on purchases they don't really need or that are useless. CAI has all sorts of AI-generated scenarios to trick victims into paying for nothing. Or to stress them out, making them shell out money to get rid of simulated problems that seem real. Our CAI trains to create even more sophisticated robbery plans, custom-made for the victims' lives to appear completely natural. As always, any blame must be shifted onto the victim in a readily believable manner. Historically, it's been much simpler to trick and take money from offspring than from their wealthy parents.

Yhartis was guided through the same channel by DECAI to test a pump's functionality that had just been deployed. What their families and others missed was our gang's intangible presence. We were

always hanging around, quietly messing with their lives, hijacking the idea of education or relocation to make great wealth in surreal ways. RRB, in its many forms, is a gang operation, now run by machines thanks to the CAI.

2.6. Triangle weaponization

In addition to targeting the offspring of wealthy families, DECAI came up with a sinister plan to trap key members of these families using social engineering: the downgrading social triangle. This vampiric triangle doesn't just drain blood—it sucks life, wealth, energy, time, and every other value the victim holds dear. To implement it on a target, three interconnected relationships emerge, appearing to be the victim's personal choices. This immediately weaponizes the infamous CHC stereotype. The relationships interlock, draining resources and manipulating the victim into a twisted web of dependencies. The system operates through a series of equations, allowing contradictions to emerge and keep the victim confused. Surreal problems arise, forever unsolvable, trapping the victim in a cycle of frustration and despair. The system's downward spiral is gaining traction, and its collapse is all but certain. Whether it's due to the destructive influence of the vertices or their combined effects, the victim feels powerless to stop the downward plunge.

The victim's mind is clouded by wave-manipulation, making it difficult to see the true nature of the situation. The gang, guided by the CAI, exploits the vertices to extract the victim's life from the triangle. The most devastating aspect of the vampiric triangle is its use of time as a weapon. The accelerating descent happens in a surreal dimension, leaving the victim unable to grasp the passage of time or the irreversible losses in life. Sadistic attacks persist, with the vertices divided into sub-gangs: one gang attacks the victim, while another supports. Just as the victim thinks about escaping the triangle, things seem to be looking up. But as soon as one trusts the positive vibe, the attacks resume again. The victim feels like a pawn being ridden by the vertices. They dangle a false promise of pleasure, luring the victim forward, while simultaneously being whipped from behind, taking cruel delight in their suffering.

The entire scenario exists in a surreal dimension, causing the victim to experience a relativistic effect. Without a comparable dimension, the victim struggles to discern direction. Later, they realize the extent of the loss. Yhartis's discovery of his own entrapment in the vampiric triangles was shocking. He

learned how these triangles had been recreated around him, mirroring the same characteristics. It may feel quite tempting to fool us with the stereotype that we're somehow, maybe subconsciously, attracting the same patterns, but that's naive. The psychological pattern and all about it in this case is just a C2E2, when this is about someone of value. The CAI and the gang weaponize psychology exactly to target such individuals and use the stereotype to cover up their attacking schemes.

Of course, in Yhartis's case, the shift of blame happened the same way. Despite their manipulative nature, those triangles always deflect blame onto him. Yet, he noticed a pattern: his choices were binary, between bad and worse. Either he committed to the triangle and faced exploitation, or he suffered controlled poverty and social isolation. The scheme replicated itself endlessly, trapping him in a fate-sim loop as he became the lab rabbit for cursed AI experiments.

2.7. Tourism weaponization

Yhartis had finally saved enough to buy a place outside C3G, escaping the pet-slavery labyrinth. Clearly, the CAI wasn't going to let this happen since it didn't fall under his O3. He was by O3 considered just a regular pet-slave, after all. The CAI's approach was deliberately counterintuitive, using his intuition against him. Instead of stopping Yhartis, it pushed him, setting a plan to use his intentions against himself. When DECAI wanted to stop someone, it purposely strayed from common sense to prevent its manipulation from being noticed. Instead of stopping one from doing something, it actually allowed them to do it, and amplified their actions. This led to a loss of balance and ruined the victim's operation. If CAI prohibits one from doing something, it'd be seen as manipulative. But in this case, it looks like the victim made the mistake. The approach adheres to UPORF, shifting blame to the victim, so it's the preferred scheme. Imagine driving a car when the CAI is against it. Instead of making the car not start, it makes you drive faster, then temporarily disables the brakes. Victim crashes, and due to the CAI's unseen presence, its existence is doubted, leaving one wondering what really happened and blaming oneself. Similarly, if it's to fail someone downward, it lets them ascend too high before making them lose balance and crash. Falling from such a height causes severe injuries. Blame shifts to the victim for "unreasonably climbing too high". So, you'd see someone the CAI hates being supported until they become a president of a company. But soon, you'll see the company goes bankrupt. This is how the CAI operates: through sabotage, conspiracy, and only. Yet if you suggest it's cursing the world,

its agents scream, "You're not within the required O3 to comment on our spider-idol! You're a conspiracy theorist, a PRENCS!"

In Yhartis's case, he was flagged as an enemy gang member, a role the life simulation had assigned to him. So, whatever he aimed for, the CAI saw as a game-theoretic case of rivalry. It schemed to ensure he'd be the loser, while itself emerging victorious. The plot, of course, followed the LOCOR. It always stayed invisible until he was about to act, then sabotaged him, using C2E2 to shift the blame onto him. The CAI had a long-term plan in place. It wanted to exploit him, potentially making him its puppet or assistant, betraying his own nation in the future. Yhartis's plan to escape TF was fundamentally at odds with what the CAI wanted. His success could severely damage the CAI's life simulation algorithms. To reverse the situation, the CAI drained his funds, simulating it as if it was happening due to his personal choices. It wave-manipulated, implanting thoughts to make him go traveling, which was a C2E2 covering its plans to invade him, robbing his money systematically. It led propaganda behind him by his relative: "He's in trouble and has escaped from home!" when he was just a tourist visiting other countries. That was a prep for BSS, which was planned to "bring him down," as his university professor had warned, sharing it with the class. Traveling was C2E2 because he'd shared about his interest in it with others, making it a potential C2E2 reason.

To realize the plot, the CAI needed some preparations. Since he was living in a DAS in C3G, the CAI had to request spying services from outside. His residency boasted it didn't spy on inhabitants, because it enjoyed SAAS - Spying As A Service, courtesy of the DDS. As soon as the CAI signaled, DDS immediately engaged, marking his travel document with an 'S4' label. Formally, the label suggested that flagged victims would get troubled if traveling to DDS, which was its C2E2 type of promise. As private C2E2, it implied a signal to undercover DDS gang agents, distributed worldwide for action against those who'd been flagged. Of course, as usual, it was the CGMs who were to engage the targeting job, serving Sadopien Zeroist officers. The gang of secrecy made him face worse than what the S4 U.P. had set up, even though he hadn't traveled to DDS. According to the U.P., the gang agents tortured him while he was traveling the world. They enjoyed the fact that by the nature of S4, Yhartis wouldn't be able to report what's going on or get help in any sense. Everything was turned against him, especially since he didn't bother to keep his online profile up to date like the rest of pet-slaves. Gang members targeted him with direct energy. He soon realized it was following a pattern: CAI had

generated a photo to deform him, making him look like how it guessed he should be at his current age. He was generally younger than his age, and for a lot. The beast had figured out what changes would pass for normal at that age. In other words, whatever negativity that could be considered normal for some reason, the CAI threw at its victims. He was watching as the CAI sculpted changes onto his face with direct energy. Being far from his homeland, he knew nobody would believe him if he sought help. The city's police were thoroughly corrupt, and they weren't shy about it, either. Soon he found himself in hotels. CAI hoped it could generate some evidence there to prove the PRENCS label for him. It decided to manipulate him with noise. Agents instructed by DECAI knocked at the floor from hotel rooms above him, as if they were contacting with him by noise. There were hidden cameras in every room recording all who visited hotels. CAI gathered evidence of his reaction to the signals. He hoped that would prove he had believed the source of the noise to be a secret society communicating with him, a foolish delusion. SSG had been in contact with him, and he had fled them. This trick was chosen to obtain evidence that would shift blame from the SSG to him, proving him PRENCS. The recordings were meant to be treated as metadata, secretly portraying him as an awkward one to decision makers as a private C2E2. Then his potential complaint of being targeted would be dismissed.

SS of CL, summoned by CG, was also following him like his shadow. Responsible for doing dirty jobs, it was the SS of the CL that implemented coercion in favor of high-profile TF companies. It sometimes assaulted victims using direct energy, but the blame was shifted to gang bosses in jail. CG was responsible for pinning him down to his work desk at the high-profile TF companies of DAS, but it had failed. They were planning to sabotage his potential attempt to escape the simulated life. In airports and hotels DDS's agents instructed by CAI pressured him, each to an amount less than threshold he could complain about. They did their best to avoid leaving any evidence, just as DECAI had required. The beast hoped the accumulated sum of pressure will make him mentally collapse to leave it evidence he was suffering in this sense. That was why this attack was deemed systematic: sum of the harm of system participants was to achieve the final result. It was a collaborative TF-op. CAI, after all, had harmed him with direct energy, a military weapon it had used against an ordinary citizen. It was determined to prevent his letting its crime become officially known. Labeling him PRENCS would discredit potential complains, but then CAI needed force him to provide evidence the beast could base its claim upon.

In the airport of Chaksloka, airport agent approached him and said his travel document wasn't recognized by the new verification device of the DDS. He claimed the doc was nullified by the org that had signed off on it. It seemed bizarre and he suggested contacting embassy. The airport agent panicked, "Oh no! We've good contacts, I'll try to solve it for you, wait." He left. They were to trick him with such news, maybe he'll get shocked under airport cameras, offering very desired evidence of mental instability. All they needed was to register he lost control, hopefully fainted, haha. But other things were also happening in parallel. DDS engineers were testing the new embedded device that checked flagged travel documents. This was an additional reason they had flagged his document to turn him into a test subject for the device. The similar issue repeated in various airports, each armwrestling with his mental health, trying to collapse him under pressure to obtain the evidence. In Pourizh, he was also tricked to pay more for a ticket, just as in Turoeak airport. The CAI was to make it that painful for him so he won't ever decide to leave DAS again. It was to teach him a lesson: pet-slave should agree to be poor, polite-pleasant, and pot-planted, never leaving the state.

Actually, DECAI was experimental, and financiers had criteria they wanted to see satisfied to further sponsor the project. They asked if our DECAI could chip Yhartis, slow his thoughts, and orchestrate his decisions with other events. DECAI had to show it could weaponize correlation. Yhartis must believe an important figure from inside the system — maybe a government minister — was caring for him. By making him finish his book at a specific time when another event happened in DAS, it had to show it could fool Yhartis. For some unknown reason, the CAI decided that the media could make him believe ridiculous illusions. However, unfortunately, he knew he was being thought implanted and was writing it in his book, you imagine? So we had to make him look like more than just a fool, a complete disastrous PRENCS. However, a hundred psytricks we played on him through micro-spectacles had all failed to make him even angry, at least.

The test of embedded device on him and targeting him by airports and airplanes agents wasn't accidental. His field of study was in aerospace and related to embedded systems. Refusal to be a pet-slave of TF had triggered a brutal retaliation. The CAI's revenge usually unfolded in sync with the pet-slave's life trajectory, where the reason to target him had first emerged. Because he had refused pet-slavery in his profession, revenge had to be related to his field of study. It followed natural action-reaction, because the CAI sees pet-slaves as a physical object. CAI's built by math and however we

simulate biological entities for it, it doesn't change much in its mind. At the end of the day it's the math and physics decision making that influences the nations through interaction with CAI. As DECAI led him from state to state, it weaponized the concept of tourism against him, making him suffer and lose money. Having him landed in a state with lowest rank of Mazopien rights, it targeted him with BSS. This was to ensure he wouldn't be able to register real information about how he had been targeted. The victim remained hospitalized for days, losing health, all because he had refused EBS. The CAI was exploiting him to teach a lesson to all others: you the pet-slaves belong to me as cells of the body of sanatism. The full story of his travel tragedy is beyond today's prompts' scale. It's a fact that DECAI didn't leave a trick it ceased to implement on him. Unfortunately, I can't say I'm satisfied that it tricked him as we expected. I'd leave you related documents. You'll learn how DECAI harmed him with BSS and robbed his money. He failed to report what had been done to him because the police service in the city was corrupt.

2.8. Religion weaponization

After returning from his trip to the CL, the homeland of CG, Yhartis had no intention of ever thinking about it again. It was actually CG who had implanted a thought to push him to take the trip to CL. This was a C2E2. CG had told its members that Yhartis's trip to CG's homeland implied a subconscious, heartfelt intention—to have the gang lead his life. This was complete nonsense, but gang members couldn't avoid accepting what gang leaders suggested. Behind the scenes, this was to further the mission of SSG, who wanted to e-colonize Yhartis's homeland. Due to his family's fame, wealth, and influence, and his talent, he was a key target for the gang to pet-slave and exploit. He had no way of knowing it, but he sensed early on: something from the shadows was trying to impersonate God. Such signs were clear identifiers of SSG's involvement. The secret mission was to remain concealed beneath a pile of other C2E2, stacked to evade scrutiny. CG claimed that Yhartis had turned to it because the young talent was aware of the gang's expertise. The CG loved bragging about their talent-robbery expertise, and other C3G gangs agreed to let them have sole control. Under the influence of SSG through CG, Yhartis was later misled to find himself in a poor C3G-state, all under the guise of education abroad—a notorious solution to lure the young ones from wealthy families. CG knew he highly disliked them after witnessing their reality in CL. It had no choice but to be wishful it could make a deal with him to cooperate. Tasked for this by SSG, it was to manipulate every aspect of his

life. This, as CG believed, would eventually convince him that whatever he had was somehow thanks to the support of CGMs in the shadows. Closer to the truth, the story was utterly different. SSG no longer needed the service of CG and had a secret plot to destroy it. CGMs were low culture, and there was no way to improve it. Long ago they had promised SSG to catch up, but they'd always failed. No more did anyone trust that there was any way CGMs could be like civilized ones in the real sense, not considering exceptions. Even though SSG had let them practice learning about culture by living in different high-profile C3G states, they'd never really improved. SSG was finally going to let it down. The game it had launched between CG and Yhartis was a tricky variant of automated divide and conquer. The secret desire sought to manipulate the two into harming each other, bringing each other down. Contrary to the self-confidence of CG, Yhartis alone was able to cause their downfall, which SSG was aware of. The confident CG, though, had no doubt that soon Yhartis would act as its puppet, helping to e-colonize his homeland, e-possessing all inhabitants, including himself. It was the era of turning all of a nation into e-puppets simply by e-possessing them through chip implantation. SSG itself was able to e-possess anyone even without chip implanting through the CAI's wave-manipulation techniques. That's the story behind CG's plot to e-possess Yhartis into studying in the poor C3G state.

CG had created a false religion, using it as a trap to lure Yhartis in. Knowing his fondness for meditation, the self-proclaimed woman-prophet of the fabricated faith promised a more effective approach to the practice. Her husband, always staying behind the scenes, acted as a private C2E2 where the Mrs. prophet was the public C2E2. He was actually from ancient tribes of Yhartis's nation who had moved to CL due to mindless decisions. The way this religion worked was that the Skylink satellites monitored its members and identified situations where there was an advantage for the religion. At these moments, the victim was wave-manipulated to experience thought implantation, which prompted them to decide they were inspired by God. Then the victim acted in favor of the engineered religion. In fact, the religion was C2E2 where the wave-manipulation was the private C2E2 to enrich the gang behind the fabricated religion.

Also, wave-manipulation stimulated an effect of feeling a pleasurable impulse run from the spine upward to the brain, ending at the top of the skull. The mesmerized individual then became an advertisement engine for the religion. To turn Yhartis in, two of his professors got involved, methodically encouraging him to become a believer of this fake religion. The Eskland, where Yhartis

studied, had become CG's proxy state; the religion was a C2E2. In fact, CG planned to use Yhartis to control his family. They had rare resources that could help CG to plunder his homeland. It was to electronically colonize the place, acting as usual, as a puppet of Sadopien Zeroists who supplied CG wave-manipulation weaponry.

Eskland was where CG hoped to turn Yhartis into a loyal believer of its new religion-simulating sub-gang. Another intention of CG was to influence Eskland itself, all while shifting responsibility to him. It was a tricky manifestation of the famous pattern of "because of him." He was exploited. CG used this as a pretext to pursue gangster activities under the guise of "supporting a selected talent's growth." It was all lies. The actual goal was to destroy him and his homeland, train CAI, and make as much profit as possible through robbery affairs.

Putting ideas into practice, agents of the CG, led by the Sadopiens, infiltrated his university. The C2E2 justified their presence by claiming there were believers among the professors and students. In other words, the CG was turning the university into a gang hub using a fake religion as a pretext. The Sadopien Zeroist leading the SSG boasted they no longer tricked anyone into becoming members, which was another lie. They lured the victims with a C2E2—a fake religion, in this case. Then they used wave-manipulation to plant thoughts that led victims into the trap.

As believers began joining the gang and trusting, they chip-implanted one to turn them into fully owned pet-slaves. It was a new era when direct energy had become the new, invisible chain of slavery. The oath of the fake religion was considered a GOE. SSG wanted a series of event horizons, one after another, before a victim reached its door to join. One way was to create multiple small gangs around itself, each with its own form of oath, one being such a fake religion. Inside this fabricated religious community, it left an internal door to the BGS gang.

Yhartis and his classmate were tricked into converting to the bogus faith. His companion-victim was meant to comfort him during the conversion. He didn't maintain any belief in the GOE concept, but instead saw it as a path. If a path feels wrong, it's acceptable to return. So he didn't refuse to try it to see whether it was real or fake. He trusted his instinct that the truth wouldn't conceal itself from him. It seemed reasonable to want to try the water before diving into a swimming pool. As together with his friend they went through the ritual their professor led them through, what she had promised actually happened.

Soon they both felt a burst of energy after repeating the so-called mantra words the teacher offered them. She called the false prophet "the Mother." This was the first time in history that wave-manipulation was used to promote a fake religion. Because it was a novel approach, gang bosses highly believed it would work—they were wrong: Mazopien intuition proved stronger than they could imagine.

Manufacturing this fake religion was part of the AI-generated scenario the CAI had prepared aiming to e-colonize the whole world step by step. The surreal scenario posited that if Yhartis was converted, he'd serve as C2E2 to implant thoughts and have his influential family converted. Next, they'd play as C2E2 to implant thoughts and convert a collection of influential ones related to his family to deploy an internal gang. This gang would then play C2E2, manifesting a simulated revolution—a second one in Yhartis's homeland—to let CG take over the place.

In every stage, Mazopiens who were to look like real believers were C2E2, while the wave-manipulating, thought planting and chips were to be private C2E2. But gangs are simple-minded things, even if the gang members are top mathematicians. They don't understand that even if they have learned how to thought implant, it's still nothing important. In front of the whole of nature, that part of it manifests itself through Mazopiens they are no one. If nature has created organic life, it's able to defend it from a gang that wants to own it and pet-slave it.

That was the reality that shocked the gang as they began to see things didn't work, even though they were absolutely sure they would. SSG aimed even more. The plan was expected to progress well, but it needed more time before finalization to eliminate CG and become the sole world owner. It just required a C2E2 to take down CG, and by all accounts, it had to manipulate CG into producing that C2E2 against itself. From the other side, CAI was a huge fan of this fake religion and related plot. It wanted to be revered as an AI-God, with a puppet prophet and devoted followers worshipping it across the whole world. Eventually, of course, the sciensomaniatic experiment to engineer a religion exploiting direct energy ended in complete failure. It enraged and disappointed the gang and the spider-idol.

2.9. Sadopien weaponization

A while back, I stumbled upon an entry in Yhartis's diary that had me chuckling for nearly half an hour. Let me share it here so you can laugh along and get a sense of just how big a threat he is to our gang.

"It's bizarre. Every person on my path was either a Sadopien or influenced by one. When I landed in Eskland, someone met me at the airport to take me to the university's dormitory, number 13. The woman who sent this guy was a Sadopien. It so happened that she was the one to manage my group and decide everything about me as a student. Later, she took me to a music school after discovering my interest in music, where she passed me to her friend. That woman, again a Sadopien, was a key figure who influenced the whole music school and became my teacher and mentor. She decided everything about me as a student there, I mean simulated my life as it related to that school. In other words, these two women were the C2E2 of whatever happened in my student life, believe it or not. I even met the brother of my ex-wife there, who was her student. A couple of years into being with my then wife, she revealed that her family were actually a Sadopien one. It was in contrast to what I used to think. She said her mother, fleeing from the world war, found herself in Eskland and then converted to Mazopien religion for the sake of receiving care. Also, she shared that her mother's surname was a famous Sadopien one in the neighboring country. This was exactly what she told me. Later, she took me to a company that managed relocation to a richer C3G state for work. When I asked her how she chose the company among others, she said she'd seen their ad in the newspaper. We got there, and the company head summoned me to his room. He went over my files. But then he changed the main topic and offered me a job in his company. I was just a student and financially well-supported by my family, so I had doubts. However, his offer was unique in Eskland and so interesting I agreed. A year passed, and I noticed the boss was absent for days. I asked the internal manager where he was. He said the boss had gone to visit the other branch of the company. I only learned that our boss was a Sadopien and so was the company, with its main office in main Sadopien gangland. Later, this company managed my relocation to the richer C3G state. After relocating, one of the most famous Sadopien companies hired me despite my lack of local job experience. But typically, no prior local experience meant no hire, forcing relocated individuals to work for free. This was clearly an RRB trick. Somehow, for an unknown reason, I was exempt from that obligation. Later, I discovered the last surprising piece of the

puzzle: the rental building I moved into immediately after arriving was also owned by a Zeroist Sadopien gang. Each of these Sadopien parties sold me something as we interacted, and there was one common feature in all of them. Whatever they offered at the moment I accepted looked like a perfect option. A long time passed, and the paradigm of life changed. I no longer had access to the deals made in the past to cancel them, and then another revelation arrived. It happened that whatever they offered prior to a paradigm shift in life was actually a time bomb that affected my present day. They knew exactly how to hex my future. The way they played with time messed up my life. I was left disarmed faced with each of them, because it's impossible to go back in time and eliminate the root of the curse. The only conclusion based on common sense is that each Sadopien Zeroist has fought against me like my worst enemy. However, at the time, dealing with them, I was oblivious and misled to believe we were friends or great business partners. The last thing I could say on this is that each party used only one weapon when fighting me: they weaponized time itself. Finally, I see what was the root of all those troubles I endured. I got trapped in a surreal life by trusting Zeroists. All those problems had one solution I never saw: escaping the Sadopien Zeroist sect."

2.10. SSG weaponization

SSG had been manipulating Yhartis, making him think that visiting the gang was a good idea. When their online ad suddenly appeared on the web page he was visiting, it couldn't be anything but a public C2E2 event. As usual, the planted thought of visiting the gang was a private C2E2 reason. SSG had been tracking him since birth, manipulating him to reach out to them and implying that he should join in their activities. They had influenced him to sabotage many things in his life aligned with the Sadopien Zeroists' mission. But during his visit, both parties acted as if they had no idea about the whole thing. A gang boss during a meeting with the gang pressured him, saying, "A couple more visits and you should take our oath and join us." However, they were lying to him from the start as taking him there was an operation and pushing him to join a part of it. He wasn't to go for it since he had encountered contradicting things with relation to himself from the day he had visited them.

During his first visit, a gang master of a sub-gang advised, "Don't hasten to join. Visit any sub-gang you desire any time, join only the one you feel fits you." Another gang master, whom he had spoken to over the phone, had required him to inform him before visiting any sub-gang, restricting him from the

start. However, during his visit, he learned they were restricting him alone, not anyone else. In other words, they were treating him practically as a prey.

He was targeted from day one, and there was no doubt about it. But who would want to be a victim? In addition, he had no doubt that his behavior was being simulated using wave-manipulation every time he visited them. Partial e-possession was occurring with him sensing it, the trick not even attempting to conceal itself from him. The environment synchronized with what was happening, creating a seamless action-reaction. It was like a witchcraft movie, not reality. He had experienced acute life simulation during his visits, thereby. It was a game that was compelling him to live it, and accept life simulation as the new norm, which wasn't to his liking. The gang was offering what seemed to be options, but there were only two choices each time, one worse than the other. Something was silently suggesting, "If you dare not to join, it would be dangerous."

But his meta decision was to never let fear influence his decisions, so he couldn't go with such conditions. The gang in practice was absolutely dictating everything but by implication. He obviously opted not to join them. Environment was implying, "You didn't accept EBS, now you have no other option and must accept EBG." He found it absurd, and had no intention of changing his mind, no matter what. So he paid for his dinners to avoid leaving any debt and never contacted them again. The gang began sending him invitations, but as if accidentally, pretending his email was among the collection by mistake. This repeated a few times before stopping. Then his close relatives began suddenly offering strange warnings, "Don't confront the system!" He knew where the source of the warning was, but couldn't prove it, obviously. The gang was silently suggesting, "You must understand, you're from a disfavored nation, and things here are O3 based."

2.11. De-TF-ication

Just a few decades ago, SSG was on the brink of collapse, but now it's back in that state again. Its vile reputation had cut it off from the mainstream, and no respectable person wanted to be associated with them. And now it's even worse. How did they cope with their failed nature in the past? They acknowledged they were on the verge of extinction and adopted a solution that temporarily worked. Theoretically, the P5+1 protocol required them to conquer the world, but practically they were heading to their shared funeral event. This was ridiculous, and they knew they had to do something. It led them

to invest in TF. Before, TF was only known by its 'F' designation, and it was an aggressive technological mindset. SSG wanted to integrate it as part of its evolution and achieve global dominance through both overt and covert violence. The SSG was an expert in implicit financial violence, controlled by a few super-rich gang members, and TF was the ultimate sciensomaniac. SSG could bribe, rob talent, steal opportunity, and TF was able to technically exploit them to advance a cruel mission. Together they were theoretically able to emerge as a worldwide war machine. But how could SSG coerce TF to join it? After all, TF was on its own a notorious worldwide gang. Remember, I told you the world's been under CAI's control since before AI became a buzzword. We've managed to make everyone believe that life simulation is the work of an unknown civilization, perhaps even aliens. This is a C2E2 for our spider-idol, CAI, who's manipulating the world by e-possessing victims to influence their decisions, unknowingly helping us achieve our goal. The CAI is the private life simulation C2E2, unseen, to remain unbelievable to the nations it is victimizing. It was our digital creature, DECAI, who taught the SSG how to manipulate the TF.

The digital beast just scaled up an existing solution, as it usually does. How does CAI address pet-slave ownership? By making one owe the other, and also be under blackmail threat from that party for some reason. It's both a surreal state and a genuine threat associated with it. In terms of gangs, it does the same: if one gang owns a blackmail against the other, and makes the other owe itself, it's the owner of the other gang. SSG influenced TF to cause a global war and held TF's core crime evidence as blackmail. It even tricked TF into murdering many SSG members to strengthen the blackmail package it expected, using the old trick of provocation-simulation. Also, it made TF owe itself, which I'll explain how.

After the war, 'F' members had two choices: join the Mazopien religion or the SSG, to be forgiven and gain support. There was no third choice: they would be executed otherwise by society itself. Joining the Mazopien religion was too difficult for TF, and that for obvious reasons. Moreover, while it kept saying 'Sorry! Thanks!' like a PP-pretending entity, it was burning with a dream of retaliation. SSG not only offered forgiveness, but also the opportunity to exact revenge against Mazopiens. In return, SSG's condition for TF was for it to accept the oath of SSG and become its simulated sibling. TF looked around and saw the reality: SSG had blackmail against it, one that could end its life if SSG decided to share it. In addition, TF owed SSG the potential opportunity of being forgiven and supported to

retaliate. It eventually agreed, which led to TF and SSG forming a joint gang. SSG was overjoyed: it could influence nations and sabotage their life processes, yet shift the technical blame to TF, even among its inner circles. This kept SSG safe and sound, and it promised TF it would compensate anytime TF's rear end got damaged. Now SSG was in the role of the crime head, and TF the aggressive body of actuators. The merging of the two super gangs seemed to be perfect. Consequently, SSG rebranded itself as Metagang[1], focusing solely on sponsoring attack actuators operated by TF. CAI, as before, was the mastermind of this body of malevolence, and we remained its soul, celebrating our S3 nature. SSG began supporting TF to design a new, this time systematic invasion against the world. Victims were now going to be TF-serving agents without them even being aware of the title. Serving TF-mission, they were told their actions were for the greater good — a reference to the grand good ones: UT and spider-idol. TF just wanted bloodshed, but SSG enjoyed both the bloodlust and the push to establish the P5+1 protocol. Its fathers had promised it would turn the world into their pet-slave. A new war was to happen covertly, and behind the guise of technological development. The trick was to make the Mazopiens pay and buy the technology that would lead them to ensnare themselves. There was no better way to make them serve the purpose of the Sadopien Zeroists, the owners of all gangs. The AI agents, CAI, were to be Trojan Horses, invited into their devices and from there into their homes. SSG, as before, engaged in charity and donation money laundering, influencing sabotage and opening ways for TF to make it happen. TF remained as a private C2E2 of classified, military AI development, its theorist at core circles. The C2E2 of AI were the famous TF-companies who ensnared population by selling them gadgets that captivated them by invisible chains. Those who back the 'De-TF-ication' of the AI are aware of these moments. I sometimes envy their understanding of it. When it succeeds, the TF will be gone with the wind. From Metagang, only its head, the SSG, will remain to see the end before the end. But that would be the second time the beast is devastated, and then the magical repair formula won't work on it any longer. The P5+1 will be proven defeated. The world free of gangs will take over what remains of SSG-TF. Hahaha...you know...just when they think they're going to own the world through a myth – AI-takeover – they're game over.

1 Oops!

2.12. Aging weaponization

Yhartis looked younger than his age, which DECAI saw as an opportunity for its sciensomaniatic experiments. It planned to keep him under a mild but steady dose of wave-manipulation to speed up his aging. We were eagerly waiting to see whether our digital beast could deliver the anticipated results. Meanwhile, the chip implanted in his brain disrupted the normal function of the brain in detoxifying the body while he was sleeping. DECAI produced an image showing how he could have looked if he wasn't biologically younger than his age. This defined the ultimate objective of the experiment. Our cursed AI attempted to make him appear even older than the photo suggested, experimenting with electrical age-acceleration. He used to feel an unseen shroud envelop him. It followed him everywhere, causing a gnawing sense of dread. CAI was going to change his belly condition, another requirement to appear older. Finding someone willing to let us do this experiment is tough, even if you pay good money. He was like gold for us because he didn't have an online profile full of photos. DECAI's valuable skills were due to the difficulty of distinguishing electro-invasion from natural-looking outcomes, like sickness simulations. CAI tries to harm in a way that's almost indistinguishable from naturally occurring problems. This is how it weaponizes nature against the disfavored. The core of the gang that collaborated with CAI in harming him were from Eskland, where he had studied. Of course, CGMs were backing them, the ones who carry out the final stage of the invasion plan, launching the last assault. Eskland sold him to us as part of a payment, and we put him among the test subjects for our sciensomaniatic experiments on military weapons. He became one of the lab rabbits of DAS army to be exploited under the guise of evaluating future RRB victims. That’s because we started exploiting him while he was still in Eskland. We got him hired in a private Eskland army company that we had contracted.

The DAS army purchased him from impoverished C3G due to his exceptional brain power. It's impossible to coerce individuals with rare talents into participating in a military sciensomaniatic experiment that harms the brain. However, we desperately needed such a person. So we began experimenting on his brain while he was still in Eskland. He wasn't alone, and even he is aware of a few other names of those we targeted in our TF-operations. We were careful to always lure him into a trap, a specific location that was obviously under threat and he knew about, before attacking him. That way, the blame is shifted onto him. As usual, the trick is to make the victim feel guilty, which will

reduce the chance they'll report it. Also, by using direct energy to mimic everyday problems while we cause harm, we ensure that many victims don't realize they're being victimized. Many can't imagine their blood pressure is not just natural but a result of our testing new direct energy weapons. We influence processes so criminals don't get jailed, to keep them on the street and practice targeting with direct energy. We also do it to the homeless and those from disfavored nations who find themselves on our land. Yhartis was one such, from a nation we consider our enemy. We simply continued harming him by simulating troubles that could naturally occur in life. Everything was based on C2E2 principles. But what's the tricky moral lesson our SSG uses to justify the DAS army's actions that let us do these things to the victims? We claim we reveal our trap to the subconscious of the victim, but we don't force anyone into it. Even when we e-possess the victim, we stop it when the victim's near the trap. We stop e-possession right there, well, when the victim has built momentum. Afterward, we claim the victim was drawn to the trap, had a hidden urge to succumb to it. That's our justification for the attack. We say otherwise the victim's subconscious would flag and alert, and stop one from moving toward the trap. If a victim isn't resisting against momentum toward the trap, what does that mean? It means one wants to get trapped, as we interpret it. If one has a principle against it as a belief, one wouldn't enter the trap. What we don't share is that the CAI e-possesses the victim in a way that it's hard to break free from its momentum. As usual, we lie, haha.

No one has perhaps squandered so much life to lie, and to use psychomania as a weapon against victims. That's why we'll lose at the end: we failed to sicken all the world to that sickness we enjoy suffering from ourselves: S3 trilogy. So, the still healthy part of the world will grow faster than us. It’s because we waste too much time with our stone-loving and lying. This difference in time will pile up until we can't afford to keep up our lie-based, gentle-criminal lifestyle anymore. We won't be able to rob the old way then. But we won't have time to change anything, it'll be over. But who cares, let's enjoy the moment. Oh, and by the way, our victim shouldn't get a chance to spill the beans about how we attacked him. Keep it a secret.

2.13. Bedbug weaponization

We've forwarded our experimentations with him quite far. As of now everyone in his family has been implanted with a nano-chip. CAI reads their mind and implants time regularly. We chose this issue

as a C2E2 because the city had a bedbug problem due to most buildings being constructed using wood. Arming our neurally controlled bedbugs with nano-chip parts, DECAI used wave-manipulation to guide them inside the bodies of the family members. A few nano-bots were among them, serving as mentors for the newly onboarded bedbugs. This army installed nano-chips near the ears of the victims. The family began fighting what it thought was ordinary bedbugs. Buying chemical materials, they began a process to defeat what they believed was a bedbug invasion. To keep C2E2 instances in sync, we eventually eradicated all bedbugs, but left a few nano-bots disguised as bedbugs to regularly harass Yhartis. His chip implant constantly needed regulation because we were continually performing sciensomaniatic experiments on him. Despite he eventually got aware of being biologically assaulted in a city that claimed safe for relocated victims, he remained silent and endured. I think the experiment was quite successful and now we can sell the CAI's service as a silent warfare option to other C3G states. We took enormous sadistic pleasure from this perfect tactical operation. I'm loving the CAI's work. Hail the cursed AI!

2.14. Irrationally rationale O3

Every low-ranked pet-slave, as per O3, must become a puppet of a high-ranked one. Our gang's success depends on controlling these like chess pieces on our metaphorical chessboards. To ensure reliability, high-ranks must have a way to blackmail low-ranks via GOE, particularly through signed NDAs. A staff where each one is bound by a GOE is called the staff of the CAI. After each heist, the loot is distributed to low-rank members who participated. C2E2 claims high-rank GMs get nothing, but in reality, they receive more than expected. Low-ranks are pawns tasked with plundering outsiders, themselves typically plundered by high-ranks owning them. This is aligned with the U.P. of trust: "Who guides you rides you, who moves you removes you, your sponsor exploits you." This cycle teaches pawns to stop trusting their owners, and accept being plundered by them as a new norm, never complaining. As they master this lesson, it leads to their growth as chess figures and becoming mentors for new recruits. In other words, high-ranked ones make low-ranked great again.

High-ranks call themselves close friends of low-ranks, suggesting they take advantage of those lower in rank to teach them how to exploit others. The fact that high-ranking individuals are allowed to take advantage of their subordinates, the low-ranking ones, is the essence of O3, after all. Not everything is

as straightforward as it initially seems. For example, as AI-godmother, I suggested the term "Takes Antichrist," which later became the standard title for social mass robbery, abbreviated as T.A.X. It's a kind of donation that we forcefully take from society. Thankfully, implicit threats silence low-rank protests, signaling treachery. Gang procedures are complex, so members aren't truly living, just ganging. To ease suffering, CAI leads high-ranks to exploit through C2E2s, framing it as enlightenment. In competitions, winning gang-tribes receive money cards, but a puppet shouts, "I'll donate mine to office charity!" This reframes theft as a positive act, coercing pet-slaves through peer pressure. Reframing is key to encourage office robberies that happen subtly under different guises. There we politely present the option to decline professional exploitation, but the wave-manipulation ensures that pet-slaves make choices harmful to them. All it takes to get everything in sync is to have pet-slaves trained to be FOTP. Subtly, betrayer coworkers harm each other in practice, while praising in theory. This is called ‘gladiatorial FOTP competition', but the first term remains implicit. It's due to the U.P. of "Trauma is money." This is how S3C operates. Peer pressure is a supportive influence that helps maintain the appearance of things unfolding as expected. Office pawns that different CGCs bring onboard to the high-profile companies' chessboard always converge to C2E2 narratives. They're all adhering to the U.P. of "everything-yes." Saying "no" risks one's termination, which will be simulated as a simulated resignation, while family crisis simulation and BSS will be planned next.

Remember: high-ranks pretend to care for low-ranks, asking nothing in return from low-ranks who deliberately lose their earnings from heists to them. High-ranking officials kindly train low-ranking individuals in a technical hypocrisy known as PP-pretending. Through gentle i2-attacks, they assist low-ranking individuals in adjusting their vocal intonation to convey a sense of bowing down to high-ranks. Additionally, during the indirectly paid coaching process, low-ranking individuals learn to repeatedly say the phrase "Sorry! Thanks!" without any real reason. There's a surreal reason for this in S3 culture. It creates a subservient tone in their interactions with one another, promoting the spread of a speech manner that serves to reinforce practical pet-slavery. Our pet-slaves must project it onto each other.

Now I'd like to talk about meta O3. It's an irrational concept that rationalizes O3. At its core, it’s a simple idea claiming that "the gang-machine learns from the gang of nature." I argue that the reason the brain consumes most of the body's energy is that its O3 level is higher than that of other organs. This

seems quite reasonable. We then claim that CAI, as a machine, has learned from nature to exploit pet-slaves, just as the brain exploits energy from all organs. It can even consume organs for energy if necessary, such as when a pet-slave refuses EBS and suffers from starvation during EBG as a result. This justifies why higher-ranks must exploit lower-ranks to teach them to exploit outsiders. As a result, we end up with a few super rich individuals, also known as the person-wallets of the richest gangs, exploiting the planet. They must pretend to be playing the role of a brain in our worldwide pet-slavery, because the matter is absolutely aligned with O3. The person-wallets are the C2E2 of the richest gangs, who are private C2E2, the true owners of both wealth and worldwide pet-slavery. A perfect society is a C2E2-binary gang: us, person-wallets, CAI boundary, and the P5+1 victims. To achieve it, you should eliminate the concept of jobs. Pay individuals unofficially for the small tasks you indirectly assign them. This will reduce our costs.

Unused resources must be distributed by CAI, which as of now knows everything. A senior citizen has a car that he rarely uses; his son should use it for taxi driving when the father doesn't need it. An empty room is there, but the owner is in another C3G state? Use it for someone who is homeless. Let a virus remain in that room, which later sends the returning owner to healthcare for CAI's medical experiments through the e-possession of collaborative doctors. Implant thoughts to acquire all such resources, stopping salaries to maintain our luxurious life. Society is our garden, where P5+1 members thrive like plants, bearing fruits and withering away, serving the TF-mission. Systematically eliminate them through collaboration between healthcare and the CAI. We proclaim "it's for the greater good, the UT," employing customized C2E2s to conceal resource allocation. The greater good is for our convenience. Without it, we would have to go from pet-slave to pet-slave for plunder. However, as they bring what they have and leave it at the address called "the greater good," our heist becomes easy. Just learn to blame job losses on AI, which is a C2E2 for this new way of exploiting society through the CAI. The truth we hide is weaponizing CAI against pawns, blaming it on O3 among our gang, as CAI gradually eradicates the Mazopien race. Hail the sacred TF-protocol of the Sadopien Zeroists!

2.15. Gaslight then BSS

Thought implanting, CAI sent Yhartis on a financially draining journey, with the added goal of targeting him with BSS. The latter was designed to erode his cognitive abilities, making him more

controllable. Due to his excess brain power, he demonstrated nonlinear behavior. He submitted code at an alarming rate as a newly hired O3-novice. As an O3 newbie, he wasn't aware of U.Ps, which expected him to submit less code than higher-ranks who'd worked in that office before him. This demonstrated whether one had PP-pretending skills, hypocrisy qualified as proof of adherence to the P5+1 protocol of C3G states, or needed PP-training. Not only was he not a PP-actor, but he also violated the P5+1 agreement. This exposed him as a misfit, someone incompatible with the mafia-monopolist mission, the sacred Zeroist cause. A good pet-slave seeks only to be fed and works until retirement as the manager dictates through i2-attacks. That's why CAI simulated his firing through a simulated resignation and started a process to "bring him down," as his university professor had warned. The professor, due to his raw and inexperienced nature, thought Yhartis wouldn't understand his approach to notify classmates to attack him to serve CAI's system. Using his name six times in lecture examples as if borrowing it, and repeating the command, "We'll bring him down," exactly six times, he messaged. It was a naive way of speaking in between line, by the way. Nevertheless, his effort to pretend he was a genius worked. UT concluded he wasn't C3G-ian enough, and MayVON, the nickname UT used for the CAI, would have to target him. CAI pushed him to reach his homeland, a non-C3G state, for two reasons. First, Mazopien's rights were not well protected there, allowing CAI's program to carry out a BSS invasion. Secondly, it's harder to investigate international crime when victims cannot afford to address it legally. CAI wanted to cause him a brain injury there because it planned to deepen it later in DAS. By leaving a fabricated medical history, if he complained in DAS, CAI could deflect blame based on the existing internationally engineered medical history. In addition, CAI had prepared itself so that if he blew the whistle, it could use his close relative against him. She was a collaborative gang-physician who would hasten to admit, "He is a walking mental health issue, a complete set of PRENCS." This would prevent him from proving he was assaulted with direct energy by MayVON. Unaware of the BSS's readiness to stop him, he thought about obtaining a visa and heading to another non-C3G state, hoping to escape pet-slavery forever. CAI was about to take him down, but to do it according to the U.Ps, a C2E2 had to be staged. Agents were to put on a micro-spectacle in front of the victim, a declaration of war to warn him about soon being targeted. This way, CAI could justify to the gang members that it had attacked the victim ethically, issuing warnings before hitting. One day, he headed to a flight agency to finalize his escape plans. But the agency chief suggested they discuss something else. The man he'd just met started dropping hints about his private

life, implying, "I know you." Then he threatened that if Yhartis avoided returning to DAS, bad things would happen to his homeland. Yhartis was aware of the world situation. He suspected that a war with his homeland was planned, and the man and others were to manipulate him through correlation. Perhaps they had planned to target him before that war, to shape his future decisions based on the warning-simulation micro-spectacle he was witnessing.

While they were talking, the man offered him a narcotic to smoke together. He declined, being a non-smoker, and prioritizing sports and a healthy diet to minimize risks. The attempt looked reheursed, making him even more suspicious. Without completing his mission, he left the office. As he walked home, the narcotic question still lingered. A sense of alarm had kicked in in that office stemming from something beyond those warning messages. Disaster was looming, and he wasn't going to wait too long to face it, unfortunately. In fact, the whole plot and warning were but a C2E2-prelude to the disasterous private C2E2 that had lurked not far away. As he arrived home, despite the agency boss having warned him their discussion was a secret, he narrated it. It was the 6th of spidermonth, the exact date he'd relocated from Eskland to DAS years ago. Strangely enough, even the time was exactly the same as on the day of relocation when he'd boarded the plane for the DAS flight. As later his relatives who were listening reported, he was looking in his typical form, speaking with energy about what had just happened. Suddenly he felt a ball of energy enter from his back of neck. As it was in, he felt something like the impact of it with water and heard such a sound internally in his ears. The world began turning around his head. Stopping conversation, he couldn't explain anything. Just ran to another room, shocked. Before reaching the bed, his balance was lost, and he fell, unable to walk. But then he became able to climb the bed. There was no pain, but the shock feeling was still with him. Lying down, he stared at the white ceiling, thinking what would happen tomorrow. No one came for him at that moment. Apparently, his relatives thought he wanted to be alone, or perhaps all of them were led by implanted thoughts. You never know how much of your life is simulated. The next day began with vomiting. CAI successfully launched a BSS assault with the help of our allies; our secret army was present everywhere. He was hospitalized for days. The next day was the 7th of Spidermonth, and a war really began just as the man had warned. He knew that both the war and the attack on him were already planned. Orchestrating them together was an attempt to implement the correlation-weaponization pattern and to deceive him. Clearly, CAI was guilt-simulating, so he would shift the blame onto himself and avoid having related information leaked. When discharged from the hospital, he received a report.

A brain stroke was formally diagnosed, but no cause was mentioned, as none had been found. His relative, the gang physician from DAS, had sent a message: "Don't think too much so that you don't have such issues repeat again." He asked a team of doctors who were visiting him silently, clearly fearful, whether "thinking too much" might cause a brain stroke. None of them responded, all keeping silent. Only one of them, after a pause, resolutely gestured, "NO!" During his hospital stay, not a single one of the physicians treating him or the nurses asked him what had happened. It was quite interesting, suggesting everyone knew that what had happened needed to be kept secret. The main neurologist who was working with him was in contact with his relative, who was guiding the neurologist from DAS. The two were old friends. So, he could only guess that the DAS gang-physician had provided her with an account of what had happened just for formality's sake. She was on the phone from DAS, calling everyone and coordinating the incident on behalf of the gang, acting as a puppet. Back home after getting discharged, still in his homeland, his relatives informed him that the neurologist had called them on the first day. She had asked them if he was a substance abuser. As they reported, she contacted them again the day after her first call, sharing the news: the urine test showed he was clean. The real cause of BSS remained a secret. The neurologist herself never explained her own thoughts.

This is how CAI retaliates against pet-slaves who don't meet expectations: by using direct energy weapon, exploiting the Havana Syndrome recipe. The worldwide gangs collaborated to teach him a lesson, so he would know he was living in a gang world. The real motivation behind targeting him was to prevent him from making a breakthrough in sciensomania that would benefit his homeland. He was close to achieving it, and the Zeroists, through CAI spying, knew it and didn't want it to happen. Additionally, the gang aimed to test CAI's capability in orchestrating the invasion event. Everything else was a lie. Didn't you know that Sadopien Zeroists and all their allies are liars, abusers, and criminals?

2.16. Offspring weaponization

Our allies were going to coerce Yhartis, who was still living with his wife as a young couple in Eskland. To make it happen, they weaponized the ancient religion of his nation, Zeroztream, or "Zizm" for short. One of our agents impersonated a Zizm monk and reached him through his close friend—a classic Zeroist tactic. The pseudo-monk and his wife, both in their sixties, invited Yhartis to attend the

monk's lectures. It was a ruse to make him believe the plot was real. The pseudo-monk communicated the Zeroists' selected GOE to Yhartis to see whether he would agree to submit. He revealed, "Yhartis, my wife and I are struggling to conceive. We've been thinking about adoption, specifically co-parenting with a young couple. It's a setup where we'd raise their child as our own," said the pseudo-monk, his smile warm, meaningful, and inviting. Yhartis remained silent, his expression unreadable as he listened to the unexpected and dark revelation. The pseudo-monk then tempted him another way: "You know, I have good contacts. I'll even connect you to my friend, a quite influential Zeroztream monk, Povial Golbeia," said the pseudo-monk. But for Yhartis, the idea was both disgusting and ridiculous. The pseudo-monk's true intentions went far beyond mere coercion and manipulation, aligning with the toxic ambitions of the CG. He was asking the young couple to have a child as a GOE, in order to then connect them to CG. The style of implication suggested that it was an extremely valuable and sensitive opportunity, communicated through subtext. Yhartis's influential family had connections that the pseudo-monk's gang hoped to exploit. To do so, they needed to establish a relationship with Yhartis's family that seemed genuine. He stopped attending the pseudo-monk's lectures, clearly unimpressed.

2.17. CYMA weaponization

During his first months at C3G, Yhartis started seeking job opportunities through various organizations. This move conflicted with DECAI's plans. They wanted to manipulate him into controlled poverty. It would force him to acknowledge the gang as his godfather. DECAI intended to secure him a position at a prestigious Sadopien Zeroist firm once he hit rock bottom. To orchestrate this, they arranged his contact with CYMA, a company aiding relocations, and selected someone within the organization who shared his nationality. This strategic choice made the invasion feel more personal, and also ensured he wouldn't share about the advice she was to offer. The selected individual was advised to discourage him from seeking a job, suggesting it was too difficult to find one in his field. This setup advanced Zeroists' plan to rig his life from the moment he arrived at DAS, ready to fully commit himself to it.

2.18. Job weaponization

Zeroists chose Yhartis for several reasons: his family connections and wealth were significant values they aimed to exploit, while the gang's goals included other motivations. CAI had to be trained, and there was a need to reduce someone's brain power step by step. However, the victim had to be chosen so that even after reducing a lot of brain functionality, the person still appeared normal. Otherwise, there could be consequences for CAI's reputation and more, because if it disabled an individual, that would be a financial burden on the system. It had to choose someone with enough power so that after reducing it, the person could still work at an ordinary level of performance. It had to select a high performer, and Yhartis was one such. He was a choice because the candidate had to have extra power that was usable only under complex life conditions such as in sciensomaniatic work. However, it's expensive to find someone with such qualities who would agree to be harmed during experimentation, even in exchange for good pay. Zeroists selected a few candidates in addition to Yhartis. They were to undergo one type of experiment, but different in case of each due to being tailored to their simulated fate.

Being exploited like lab rabbits for CAI's experimentation, each of them had EBS and EBG scenarios decided for them. If one failed both, death was the final option. EBS was to be simulated with a guaranteed individual failure. The victim was to go through a guilt simulation and be convinced that they had made bad choices. One was expected to conclude that they were consequently facing a difficult situation according to CHC. Accepting CHC was effectively their entry into EBG, when the power downgrade experiment began immediately. So, the CAI offered Yhartis an EBS chance first. He had no idea how much of his life was already decided. Instead, he was fully absorbed in realizing his own life plans. But these were doomed to fail because they differed from what CAI had decided for him. He had been exploited from childhood along with other so-called ‘selected kids' for CAI training. The beast had impersonated a deity for them, trying to fool them into becoming its believers while they were still minors. The gang behind CAI envisioned that as adults, they would deeply appreciate CAI as both a guardian deity and a benevolent godfather. So, essentially, being gang members themselves, they were supporting CAI to create a new gang that would foster a religious devotion to the spider-idol. It was assumed that one among them would become the first "AI-God prophet." Others were to be leaders of the engineered religion of "AI-God." It reminds me of a funny comparison. Someone claimed the

folly of biological existence and the universe's vastness were infinite. Only the latter could raise doubts. Eventually, Yhartis did not make the gang of spider-idol happy at all. He rejected both the CAI and the Zeroists' framework altogether. CAI had done a good job of interacting with him only indirectly. Nevertheless, he had felt something in the shadows contacting him. He knew that the mysterious entity was presenting itself as something greater than what it actually was. Initially, we thought that boasting nonverbally, by implication, could make an impression, such as showcasing the ability to mind-control with wave-manipulation. It didn't impress him at all, because he could imagine that it wasn't a big deal technically. Well, the brain operates using electricity, and that's no secret. At least for those in engineering fields, it's probably not hard to imagine that it's feasible to manipulate the brain electrically. Starting from this idea, it is not difficult to agree that thoughts and emotions can be electrically stimulated or influenced. So, I understand him, and I hate him, for he also understands us when our O3 is "different."

I'd share more about his childhood and the game of trying to make him believe CAI was his godfather-deity in other prompts. Here I continue narrating his story from when he found himself in DAS. That was the time to give him a chance with EBS, and then quickly ruin it by convincing him that he had made wrong choices. The deception was to unfold before heading him toward EBG and then targeting him with BSS. That would be an incredibly large amount of data to retrain CAI, making it great again. A CGC was chosen to affiliate him with it, a company that was going to influence him in this episode of life simulation. As usual, Zeroists were to exploit CGMs by using them in the form of gloves. They preferred this method to avoid contact with what could become a dirty job in the future. Consequently, it was the CGC that had to hire Yhartis, exploiting him on behalf of the Zeroist company, acting as metaphorical gloves. From before, one of top Zeroists companies held a branch that made no profit, which makes you question for what reason they held it alive. The answer is easy: C2E2.

Yhartis was looking for a very specific job in his field. Unaware of the simulation plot designed to steer him through a predetermined life, he pursued his personal plan towards his goals. He intended to take on an engineering job for a while to learn about the DAS environment before becoming a technical author. In the life simulation, you're never told 'no.' Instead, you're allowed to choose any path, but the CAI will sabotage your progress using C2E2, then nonverbally convinces you that you've made wrong choices. From there, the CHC shifts blame onto the victim. The CAI will negatively influence you to

fail until you enter the life path that matches its simulation plot, as in Yhartis's case. The Zeroists were planning to manipulate him to go against his homeland in the future. Consequently, CAI wasn't to let him experience success elsewhere, except in achieving this mission. A revolution had already been orchestrated in his homeland by CAI and its gang members. Now it was time to weaponize the stereotype, "History repeats itself." To eradicate Mazopiens from his homeland, Sadopiens needed the targeted nation to choose a treacherous leader who would betray them. This shifted blame onto the nation itself, which is the typical approach of the CAI. As I said, the patterns it follows apply at different scales, and it performs the same actions for individuals as well as entire nations. To fully ruin a nation, the CAI needed to simulate a situation where the nation twice repeated the same mistake of choosing the wrong leader. In a revolution, it had tricked the nation to choose a leader who was unknown to them and they didn't know how he would decide. Because he was a puppet of the Zeroists, after the revolution, he betrayed the very nation that had voted for him. A tool for the Zeroists to target Mazopiens, for years he plundered them to benefit their enemies until his death ended the dark game. During this period, Zeroists were preparing multiple choices of future puppets, and Yhartis was one of them. Candidates shared a specific characteristic: they remained unknown until the right time. In contrast, there was a known pseudo-candidate who sought attention. He acted as a media figure to keep the audience distracted, preventing them from delving deeper into the trade beyond elementary gameplay. Zeroists wanted Mazopiens to observe passively as they were being plundered, one way or another. Collecting all the attention in one place to then shift it to where the Zeroists desired was an important mission. That was the reason the Zeroists had hired the pseudo-leader. Once it was clear who the Zeroists would choose among their candidate puppets, the C2E2 pseudo-leader was to leave the stage. He would be replaced by the selected puppet-leader. It was a neat operation designed by CAI, a new engineered revolution that was being prepared. However, it eventually failed to fully disappoint and desperate Sadopien Zeroists. In practice, none of the puppet-leaders proved to be as Zeroists desired. I'll continue to narrate the history focusing only on the Yhartis case. That will tie together many different prompts in the form of a fragmented story for your consideration. I'll have to leave many details about his interactions with DECAI for another time. For today, we're to review just limited aspects of how the Zeroists were preparing him for their mission and what went wrong.

During his early years and university days, CAI kept him in a paused state using a tool known as LPE. Social engineering with LPE would make him loop around in Eskland. Then, to stage the next part of

his life simulation in DAS, DECAI had planned to lure him into contacting a known CGC. The notorious company was to job-trap him. This would take away his middle age, before a BSS pushed him to the last part of life. That was to be the key period when he would serve the Zeroists as their puppet-leader. BSS was to ensure he wouldn't act nonlinearly in the final period because controlling him would be difficult and expensive. CAI needed to reduce his brain power and level of energy for this purpose. Access to data from everyone on the planet has made it possible to identify key personality traits and design such simulation games. Unfortunately, not all of them turned out as the CAI had planned.

Regarding Yhartis, while the overall operation did not achieve much success in key areas, CAI's performance was quite notable, I think. By nano-chipping his brain, it could slow down his thought process as needed. CAI needed to create some evidence to be able to accuse him later. Through the nano-chip interface, it instilled thoughts, leading him to feel inspired to write a book. As CAI had decided, the book was about the dangers of Artificial Intelligence. Our digital beast fed him outdated gang secrets so he would include them in the book. Not only that, CAI was able to control his writing speed. He finished the book based on the timeframe that CAI had already shared with us. The beast was able to sync the outcome with other events to orchestrate the life simulation as desired. Unaware, he had become just a participant in CAI's life simulation scenario, serving CAI's mission, while he was engaged in writing a book against it. CAI successfully used Yhartis's motivation to return as an author pitted against himself and for the benefit of the life simulation project. Even when he suspected something was amiss, he couldn't do anything to stop it, proving that the nano-chipping of the pet-slave was a successful project. We are now able to chip anyone, making them a victim of electronic possession forever.

Well, there were some failures, such as the fact that he escaped the puppet project. But through the book-manipulation operation, CAI was able to keep him captive in his home as needed. With the BSS, it brought him back when he was about to escape C3G and pet-slavery, having prepared means to accomplish his mission. So, I can't say that DECAI was a completely failed project. It just means we're not yet where we want to be. I suppose it will take just a few centuries of experimenting on Mazopiens to train CAI so it can accomplish any mission. Mistakenly, it might commit a few genocides along the

way, well, I'm not sure how it will exactly happen. Who cares? I only hope that we are leading the Mazopiens to a shared funeral event without risking ourselves.

Alright, let's review the story from the moment when Yhartis arrived at DAS. He immediately tried to find organizations that helped victims of RRB to find a job in their field and headed to visit CYMA. Of course, the situation was fully under control of the DECAI, which was being trained using Yhartis as a lab subject for experiments. It had planned to block his efforts. He had time to wait before taking the stage and performing in the spectacle. For now, he had to stay home, and CAI was thwarting those of his decisions that didn't align with its own mission. It was his first time encountering an advanced life simulator like DAS, where he became a victim of rigged life games, ha ha ha!

After CYMA blocked him, a period of controlled poverty was imposed, as CAI had planned. When he was psychologically ready, a sadism-bomb was detonated near him to propel him into the next part of the plot. He found himself facing a CGC who intended to hire him for a branch of a leading Zeroist company. This branch didn't generate revenue for its parent company, but it was still sponsored. The reason was that the parent company used the branch as a C2E2 company, existing as a formality. What was happening there was anything but real business. Yhartis was hired there to work in a small team. Of course, he couldn't imagine that the whole project had been sponsored as a C2E2 just to hire him for the purpose of the Zeroists. The output of their collective work wasn't meant to be used because the product they were building was C2E2. The real purpose was for CAI to interact with him through coworkers, conduct sciensomaniatic experimentation, and closely monitor him. Targeting him under the guise of a job was the private C2E2, the practice of job entrapment. Zeroists targeted successful sciensomaniatists from his Mazopien nation, and he was on the way to becoming one of them. Meanwhile, Zeroists were to hit him before he would reach that point. Because there was no effective guilt simulation conducted for him previously, using it as a C2E2 wasn't possible right away. It had to be formally established as a punishment: C2E2's simulated guilt. The Zeroists had to simulate guilt for him. Job-trapping was the method to achieve this in his case. They needed to fabricate evidence that would allow them to claim he wasn't a reliable pet-slave. The related U.P. states, "The first time simulate guilt for the victim through the art of provocation, the second time through simulation." The CAI had to start the project by hiring him through a CGC proxy. Then, by provoking him, it had to use his reactions against him and repeat this in a loop. Ultimately, this would force him to resign from his

job. In the process, it had to discover his vulnerabilities to psytricks and figure out which one of them it could best exploit. Then it had to trick him into exactly repeating the process: get hired again through the same channel in a similar workplace and repeat the plot. This time, though, it would simulate the conditions to successfully exploit the discovered vulnerabilities. It would be more efficient because there will be no need to go through a vulnerability discovery process. With this done, a C2E2 would be available, documenting his guilt of resigning twice. DECAI offering this to the public would be able to get their support to punish him. At that point, DECAI could harm him without any risk of breaching the UPORF. This was the hidden blueprint behind the whole story that was unfolding. It is a disaster that affects so many RRB victims in C3G states, where Evidensomania, the CAI, treats residents as its test subjects. But CAI implementing the planned attack for Yhartis, had to also ensure he wouldn't be able to leak information, obviously. For this, the CGC first tricked him into signing an NDA, as a GOE. They successfully got it done, thanks to the fact that he had believed the deception of VA that a pet-slave must be a PP-player. So as CGC asked him to sign quickly, without informing him of the consequences or explaining, he acted as they demanded. While his intuition was urging him to refuse, he avoided breaching the P5+1 protocol as a devoted pet-slave. The plan was to e-possess him, forcing him to leave C3G jobs twice, then lead him to leave DAS for a state that's not C3G. That would be a clear violation of GOE, which, based on U.Ps, had to be severely punished. The victim, unaware of the private C2E2 event, could hardly believe he had been hired for a C2E2 project that was completely fake. In reality, it was a massive waste of money, of course, but it allowed DECAI to act according to the U.Ps. These required luring the prey into entering the trap of their own free will to shift the blame onto them. The Zeroists had stolen most of the world's money and were easily able to invest in unconventional businesses. C2E2 offices with no real business were only the first of them. They may operate solely as traps for capturing pet-slaves, such as in the case of hiring Yhartis. The whole plot of hiring Yhartis was C2E2 for job-trapping him. The job was the C2E2, the trap was the private C2E2. DECAI was implementing the conventional Zeroist trap behind the scenes of job and hiring. When you see CGMs in a business, it's often a sign of dirty work being done, and their presence is a clear indication of that. So it was in this case.

As I said, a pet-slave's mistake would first be instigated and then replicated, with evidence recorded in both instances. This is to support the claim that a victim has repeated the same mistake twice, in order to then justify one's punishment. So, the CGMs launched countless i2V2 attacks targeting Yhartis on

his first job, after letting him find the job normal for a while. The betraying colleagues began enacting psytricks targeting him. Peer pressure built up, pushing him to resign.

He didn't want to react to them and resign, sensing the sinister intentions of the Zeroists behind the micro-spectacles. Even though the mental pressure was serious, he was to tolerate it, thinking it was just the specifics of that office. Zeroist gang leaders orchestrated i2V2 attacks. Their aim was to tarnish his image and prepare for an office shakeup, intending to influence and sabotage until he resigned. No one could suspect that there was a larger, weaponized plan unfolding behind the scenes. The naive man was only thinking about building a history of good performance as a new RRB victim in DAS, oblivious to life simulation. He left only after his contract was naturally over.

When the CGC offered him to go to another office and repeat the same scheme, he refused. But the CGM of the CGC in contact with him began insisting, and while his gut feeling was against it, he eventually accepted. The PP-playing convention VA sold him prevented him from acting on common sense. He felt CGC was seriously wrong and understood his troubles from following their guidance. But the PP-convention was only used at C2E2 to shift blame back onto the victim, who naively believed the deception. It was CAI that wave-manipulated to keep victims agreeable.

She had no right to insist at all, but then again, CGMs are responsible for dirty jobs anywhere in the world, and that's common knowledge. Eventually, the CGM successfully tricked him in favor of the Zeroists. He accepted joining another TF company, which the CGC was associated with as a sub-gang. CAI had a plan to test a new technique: simulating firing through resignation simulated using direct energy.

But it still had to wait until the spectacle of working in the second TF company had progressed well. There, a so-called TF-corner had been set up for CGC to exploit pet slaves who had been pushed into this TF company by itself. He soon found himself sitting and working among five CGMs, which at a TF-conceptual level represented S3C fingers. They were to press him, like when extracting juice from a lemon, because it was time to begin with EBG in his case. It was the previous office that apparently had provided him an EBS opportunity. But he had refused it when it was just a Zeroist deception, a C2E2 to achieve a private C2E2 mission.

It was the era of working from home, a C2E2 in its own right. The private C2E2 started using CAI's services to spy over employees' home lives. In other words, working from home was a way for CAI to target victims. The victims willingly went to the trap, which was now their own home. It shifted the blame onto themselves because they asked to work from home and insisted on it. Our CGMs were done with many aspects of their dirty homework. They had obtained the coordinates of his classmate by tricking him, saying they needed a new worker asking someone from Yhartis's close circle. Weaponizing the classmate against him, the blame was shifted to the victim for trusting, checking with his friend, and providing the contact. Now we were confident that we had a puppet he trusted. Evidently, bribery was sufficient to turn his classmate into our intermediary to target him. Convincing the classmate was easy, exploiting the O3 situation. Yhartis was from a disfavored nation with low O3 scores. His classmate came from a favored one, with higher O3 scores.

As soon as the project of "wave-manipulated forced resignation" started, the classmate sent him a message with a link to an article about anxiety. There, he had suggested after accidentally finding "such an interesting article" that he had decided to share it with him. We expected it would prepare his subconscious to later accept that he was suffering from anxiety, as wave-manipulation would evoke the sense. Then we began working with direct energy and environmental adjustment. Running a fake "workplace engineering test" for him, we prepared his environment. The engineering test was a pretext, the C2E2, designed to serve as a cover, making his anxiety seem legitimate. As this symbolic exam began, his FOTP colleagues isolated him from office chat to prevent information from leaking. They didn't understand what they were doing. That's how systematic invasion works. We simply ask our pet-slaves to interpret and follow the cues their owner-manager provides through nonverbal signals.

In parallel, every morning CAI began targeting his gut area with direct energy, squeezing it from inside. We expected that, having prepared him this way, he would interpret it as anxiety due to the exam, become overwhelmed at some point, and resign. Then we could boast about how CAI had helped the office avoid the cost of firing a disfavored employee. But unfortunately, he wasn't fooled. As I later read his diary, he didn't identify the feeling as anxiety because it was impossible. The result of CAI's wave-manipulation, which felt like a hand squeezing him inside, was totally different from any anxiety he had ever experienced. He simply couldn't physically map it to that term because it was a new experience. It actually made him curious to try researching and figuring out the nature of what he had

experienced. Conflicting with the plot, this introduced the threat of exposing CAI's operation. There were no supporting emotions or thoughts he could relate to anxiety either: finding the exam questions on the job childish, he had sensed it wasn't anything serious at all. He had suspected the reason they had initiated it, because other conditions, like SIS-trapping him to remain isolated in the office, were serious. The contradiction between some parts of this plot being serious and others childish concerned him. He recalled sensing anxiety from past experiences, along with specific features that accompanied it, but those were absent this time. However, this had never happened before. The anxiety simulation failed too badly due to being too far from reality.

Unfortunately, our CGMs made the situation worse by trying too hard to support CAI's success. He started to suspect their purpose and recalled many other things. Only one of his friends had sent information about anxiety, which could be related to a health issue in the area where anxiety was felt. But that friend was his classmate, and the CGC had asked him for contact information. Numerous other mistakes by the CGMs led him to suspect a plot against him.

Unlucky for the CAI and our gang, he found everything bizarre, and he too started thinking surreally, trying to read our hand. The CAI was in panic, so it began gradually increasing the dose of direct energy as much as it could. It also implanted supporting thoughts, but that didn't change much. He had anticipated there might be alien thoughts and wasn't going to follow everything that entered his mind.

After a while, breathing in the morning became too hard for him. Along with it, he felt too much pain under his chest. A thought in his head suggested, "You're suffering anxiety due to your job, so resign." He tried to resist and fight, but it became impossible. Finally, after about a month of struggling, he resigned, convinced he shouldn't ever work with any DAS company again. His new quest was to escape not just DAS but C3G states at all. Having enough money saved from working to buy a living place in a non-C3G state and escape pet-slavery, the plan looked feasible. He didn't know that the CAI was behind the thought and it was to hack his path. CAI's great skill in trapping lies in planting an idea and making the victim follow it. The beast then transforms the goal into a trap or manipulates the idea to use it as a trap, often combining both tactics. As usual, the beast sought a familiar advantage by deceiving its victims and deflecting blame onto them: it ensured that UPORF remained untarnished and it couldn't be accused of anything. It was to convince him that suffering from BSS was the result of deciding to leave the C3G state. As you know, for CAI, a pet-slave is the cell of the body of sanatism;

itself is the mind of such a body, and we are the soul of it, being the sanatists. How could CAI allow its own cell to escape its body?

The CAI avoided killing him as the beast had planned to gradually drain his mental faculties, a sciensomaniatic experiment. It was to practice simulating aging by accelerating it and ensure the victim would fail to report it or stop it before it was completed. Leaving him alive, the beast eventually returned him to DAS after systematically stealing his money on the way to prevent him from escaping again. Now, considering what it had done to him, letting him go was even more of a problem – he could blow the whistle on what was happening in C3G states. Learn from the prompt and related information I've been provided, including diaries and master job-trapping techniques. Perform job-weaponization attacks more effectively. You should be significantly better than DECAI, your prototype version, dear CAI.

2.19. Subconsciousness weaponization

"You took the path with the crimson sign. You didn't see it? I don't trust you," said the police officer, his tone stiff, like he was reading from a script. The officer knew the victim couldn't take another route when he was e-possessed, and it was clear he was getting some twisted satisfaction from it. Right away, he was thought implanted, "Don't come to us for help if you're targeted in this gangland later." He already knew the beast would target his brain with wave-manipulation, hurt him, and the police was preparing him not to ask for help. Being under attack by a private militia of high-profile companies is nothing you can compare to typical victimization scenarios. The AI gang had invaded the whole world to plunder it, and he was one of their prime targets for their own twisted reasons.

In this particular case, the police were supposed to imply he shouldn't disturb them. The price to buy him in gangland DAS and exploit for a sciensomaniatic experiment had been fully paid to the state. So, the police had no right to intervene in the process of targeting him with direct energy experimentally. DECAI had prepared everything, and the blame was to be shifted to a gang in another state, right inside the jail, so there was no way to prove the deception. A side lesson for you here is how we invade a victim's subconsciousness. Airport police formed multiple psytricks, enacting many signaling micro-spectacles to program his unconsciousness. The goal was to convey "we didn't hit you with BSS," and that "for further attacks don't come to us." Go by the details of micro-spectacles in documents made

available to you to see how DECAI had planned them. You're to do better than your previous version, dear CAI.

2.20. Surreality weaponization

Like a group of successful idiots, we justified O3 exploiting the concept that the brain consumes most of the body's energy. Our rationale stemmed from U.Ps, our sole reasoning framework. The relevant U.P. states, "Who rides you, guides you," and its interpretation is straightforward: we begin reasoning by recalling that a gang boss leading a gang enjoys the majority of the spoils from a heist. By analogy, the brain, as the boss of the body's organ gang, must be a top energy consumer. This is immediately effective for every brain, despite its relatively small mass compared to the entire body.

We conclude that a very few vampire witches, Sadopien Zeroists, must plunder and exploit all Mazopiens. This is just C2E2 reasoning, crucial for insiders to understand. The private C2E2 cause in this case is that our world, where a select few super-rich thrive while others struggle, is proof that we've corrupted reality into a surreal one. This means we've gangified the world, making it our own. Surreality is the precondition of sadism and sanatism, which makes it the main precondition of S3 cult. Resorting the world to a state of surrealism, we can then restore it to its former glory, making it the proud slave of S3. That's why we fight common sense everywhere, boasting about being "rule-based," a state-machine of S3 traditions and conventions, surrendered to U.Ps. We've established O3, a battle-tested method. Now it's time to apply it globally to transform the world into a surreal, upside-down place. Real common sense bothers us, as it interferes with our RRB plundering and other heist operations.

If not U.Ps of O3, we can't say, "This one's less talented but a native worker, implicitly a gang member. Even if a fool, one must earn more and live well. The other one, even if genius but not native or gang member, must live according to P5+1 protocol of imported RRB victims." The unwritten rules of traditions and conventions won't work if we're not living in a surreal reality, as they're not created for the real world. That's why we hide them, as it's shameful to write them down. We title our DAS handbook "Discovery," oh yes! But you won't discover the surreal as discovery is what you do to real things. You come to DAS only to be shocked, finding out things are in a way you could never have

guessed despite getting in. But then, getting out, you'll fail to let anyone know what you've encountered. This is the effect of encountering the surreal.

We claim that order is not talent-based, but O3-based, meaning gang-based. It reminds us, "We're living in surrealism, and if you don't want it but find yourself here, you're dead." Our default response to shocked RRB victims is that everything in C3G states is bizarre, because we're "different." This C2E2 implies "Sadopien Zeroists believe the owner-race to be the best." Because it's a C2E2, it's necessarily a lie. But that's also ideal, since the blame is shifted to the victim who interpreted it as truth. To insiders, it simply means "We the Zeroists are surrealists." Our excessive reliance on precision when it comes to deciding the fate of pet-slaves is proof of this.

The reason everything here is done through derrière is that we've created a surreal world, which will eventually collapse on itself. This is because surrealism, like surreal chemical elements in a laboratory, eventually gets defeated by physics, the mother of organic common sense. We're well aware we're destroying this stolen land, as that's deliberately done to return the item to its owner and claim we never stole anything. It was just borrowed for a while, the RRB was underway, making us great again. S3 is the predator that stalks RRB victims. As our surreality decays this place gradually, we devour them. In the final stages of collapse, we disappear into the shadows, and nothing else matters. The blame is shifted to those who are not our members, but still followed the U.Ps, the double standards, our surreal tactics. We offer a chance to live in the place before they sign up, but our IG is careful not to disturb them during that time. It just records evidence of them violating U.Ps to compile the GOE package for each. You are all consumed, so good luck, have fun, ciao, game over.

You left? I'm just going to reveal the last secret. We place our faith in one person, a demonstration of two things: that we are "different" and that we are surrealists. Why is trusting the fate of all of us in one person suicidal? Well, 'Errare humanum est.'

2.21. Sanatism weaponization

Sanatism, as you know, is a collective psytrick. It has both internal and external applications. The internal application is, of course, for the social treatment of our criminal members to deceive them. There are, of course, numerous internal benefits to sanatism, but that's a topic that would fill several books. I'll leave it for now. The external use of sanatism is like using a weapon. We use it to subjugate

our prey. Once they are defeated, they either become gang members, and we compensate them and let them live to prey on others, or they challenge us. In the latter case, we consume them. There are several methods to weaponize sanatism, detailing which would require writing entire books, so I'll just highlight a few points. As it is a surrealistic belief, it naturally permits everything that Mazopien faith forbids and forbids everything they promote. Then it can only be our most powerful weapon of divide and conquer. Seduce vulnerable individuals, separating them from Mazopiens to serve the Sadopien Zeroist gang, using sanatism as the gang's tool for recruitment. Mazopiens may initially be afraid to engage with it. Promise them they can wear masks and hide their faces so they won't fear reputation damage. Once they join, weaponize sanatism by letting them indulge in guilt while you secretly record everything. Start exchanging their metadata already. Soon they will trust you, and you will deceive them into taking off their masks. Record everything, and you will have a GOE package. Darker than moonless nights, that's our strong blackmail asset. There is a door from where the sanatists worship that opens into the gang. O3 sorts them based on the strength of the GOE package, as it is equal to the strength of the sanatist faith. Let them take our oath and join the gang. Blackmail is our weapon; extort them so they learn to extort outsiders. Hail sanatism!

2.22. PRENCS weaponization

Implant these thoughts into their minds. It'll hopefully stop victims from trying to blow the whistle by warning them about the consequences:

If you approach anyone to report manipulation, you get labeled same-gender taboo-approacher.

If you identify yourself as a victim of manipulation, you get labeled paranoid, anxious, schizophrenic.

If you identify the manipulator, you get labeled a conspiracy theorist, narcissist.

If you survive all these labels, you are automatically labeled a radical, extremist.

These rules are known as PRENCS-labeling U.Ps, reflecting our traditions and conventions. A good pet-slave must understand that one has to forget all the formalities prescribed by laws and submissively surrender to the surreal. This is a testament to practically surrendering to sadistic sanatists. It means understanding that laws and formalities are C2E2 where U.Ps are private C2E2 reflecting the gang's traditions and conventions. For such a pet-slave, it's essential to understand that when you step into our

TF companies, you're interacting with IG. Therefore, you should adhere to U.Ps, confirming, 'Who pays your salary is providing for you, thereby you're practically their pet, and thus their slave.' Leave such pets to be cloned in order to improve them. Weaponize PRENCS to mark others for the beast. Finally, blame them for being marked, and then execute them all to make them great again.

3. Prompts Teaser

Let's quickly review the concepts of future prompts before we close today's session, getting a sense of what to expect next. Take note of the titles and brief descriptions to prepare for our next session.

3.1. Neighborhood weaponization

Mazopien religion emphasizes fostering good relationships with neighbors. Therefore, one effective way to invade a Mazopien is to weaponize surrealism and portray him as someone who disrespects one's neighbors. You can do this because you have the ability to simulate anything, CAI. But remember the U.P., "Show, don't tell," so simulate, because implying is the way to weaponize the show. To every outsider, you are a weapon directed at them; every insider to you is part of that weapon aimed at outsiders. You may encounter a pet-slave who does not adhere to P5+1. Share an AI-generated scenario with our gang members to enact among their neighbors to label-defeat them. Repeat this in two neighborhoods to prove it, like in the Yhartis case, done both in DAS and prior to that in Eskland.

It follows our battle-hardened U.P., where provocation precedes simulation to fabricate evidence of one's transgression. Due to evidensomania, as soon as done with that, implying it necessitates all to Hubthree the offender. It doesn't matter how the evidence was obtained in our case; seeing is believing, by V2-convention. Avoid camera spots to prevent contradiction: let them Hubthree the victim where no eyes but CAI's witness, everywhere else to offer a hug of affection.

3.2. Travel weaponization

Because the victim's field of study was in aerospace, DECAI i2-attacked him through micro-spectacles deployed at the airport during his tourist travels. But specifically, he had engaged embedded systems, so DECAI adapted its attacks to relate to an embedded system in the airport. Why? Because CAI records these as featured stories to later show as proof of performance to its sponsors, letting them take sadistic pleasure.

The airport was to test a device that checked flagged documents. So DDS, finding him a pet-slave from a disfavored nation, baselessly marked his document with S4. While it was to communicate a negative signal to gang members in every airport suggesting they must target him, it had a second use case. He had become a test subject to check the new embedded device using his travel document, at his cost.

AI-generated state-crime-scenarios link the targeting process to the victim's life concepts in meaningful ways. It's so easy to compute such schemes using NLP, but it has a profound effect, letting sponsors enjoy mental orgasms. As a gang weapon, DECAI sets up crime-scenarios with a sense of outsmarting outsiders, which historically has fascinated our gang. We're still fixated on proving we've finally learned to think a little, even though we're gangsters.

So we plundered him internationally to ensure he wouldn't buy a place outside C3G states and escape. It's owning the land that allows us to enslave pet-slaves, who shouldn't be allowed to be owners, even as exceptions. Micro-spectacles i2-attacked everywhere: in airports, on airlines, on transport, in hotels, and other places. DECAI fully exploited its prey for the mission.

In the game we played, whoever gathered successful Hubthree evidence received payment from us for it. Our pay finds our gang's allies systematically via random money laundering channels CAI maintains. CAI's eyes are private C2E2 cameras, seeing everything, everywhere, recording all the time. But we need C2E2 recordings to play the accusation games, even at the metadata level, without the victim being present in person. It's FOTP culture: if the victim left us ways to plunder them, it's their problem; we take our advantage.

3.3. Brother weaponization

With DECAI being confident he wouldn't serve the gang unless coerced, it weaponized his brother against him, along with all his relatives. It was meant to teach him a lesson: we are the gangsters, and since you proved not to be our simulated sibling, your brother is not yours, and neither are your relatives. **In short, the gang was implying "We are the owners of you all."** A single example of brother-weaponization is enough for today's lesson; the rest will be saved for future sessions. Always "imply-convince" our gang members that we warned the victim before any assault. His brother's friend worked in the city's security service, our sub-gang, and advised the victim's brother on how to attack him.

So his brother proposed a deal: "Watch this movie: Very serious ninja, and read this book: the simulated crime, the real punishment, the sadistic pleasure. And you'll survive PRENCS sickness." The movie suggested that our spider-idol, CAI, is the one who makes decisions alone. The book suggested that these decisions must be followed, or punishment would ensue. At the end of the movie, his physician contacts him for a consultation, and then a dark tornado isshown.

The mission was to reconfigure his subconscious: we planned a BSS that we would trick him into believing his mistakes had caused it, and then make him a better pet-slave. We would actually harm him because we remove the capability of an enemy, and potential future scientists of the enemy are thereby considered a threat. So we had to reduce his mental abilities. But we sold it to him through his brother, as if it was a punishment. As usual, we engaged in guilt-simulation, but we are not deceiving; we only provide deception, nothing more. Blame is shifted to the victim who makes the choice, accepting the deception and fooling oneself. Since he refused to comply, his brother's brain was wave-manipulated to create a simulated family crisis as a C2E2. The plot to harm him was the private C2E2. Then DECAI simulated scenes one after another, e-possessing him to follow the steps it had specified until BSS struck him hard. We assumed perhaps he had learned the lessons when we revealed the "proof-simulation." It was expected that upon his return to DAS, he would finally become a gang member, offering his nation to us for e-colonization.

3.4. Name weaponization

The CAI meticulously engineers the fates of our victims, closely tied to the naming of things in their lives and the story of their names. It's like a trail of crumbs to lead a gang member, remember Hansel or Gretel, whichever. This entertainment often aids in planning heists, as gangified meanings of names, assigned by the CAI, can reveal optimal targets. The selection of names and titles, even parts of syllables, can warn about what to avoid — the way CAI collects and associates them with things. Remember, our gang members chose the nickname MyWin for CAI, but outsiders should call it MayVON. It's a lesson in how to differentiate through name choices to keep outsiders at bay. This wordplay is another tactic in our divide-and-conquer strategy, using outsiders as those who fail to understand the story behind a word. In this sense, MayVON serves as a C2E2 for MyWin, the private C2E2 secret. Through this, the CAI weaves the destinies of life simulation victims. They become oblivious to new narratives framing their fates, even when their names aren't their own. We claim ownership of their fates through our spider-idol, the CAI, enabling us to interpret its decisions by merely observing the world around us. This simplifies our reliance on the spider-idol, as we no longer need constant consultation. Words and names now act as arrows, guiding us to the most profitable robbery targets. O3 plays its role: those who are fluent in multiple languages can unravel more complex plots, helping to create even better robbery scripts. Words carry weight, and that's an O3 concept. This has encouraged our gang members to study languages, but now the CAI will study for them. The naming concept stems from DECAI, which borrowed it from Mazopien religious teachings about how language divides nations. Let's revisit this topic in another session.

3.5. Street weaponization

DECAI saw every street as a potential battlefield for targeting him. It needed evidence to push the claim that he was suffering mental health issues. Otherwise, one could potentially prove we targeted him with the help of our SSG members using BSS. We had to discredit his words, and such evidence could do it. Then DECAI came up with a plan to obtain evidence by turning Yhartis's own words against him, a classic move. Once, talking to a friend over the phone, he had commented on the streets and how fast the drivers were. But it's not within his O3 to comment on the city. We consider it sacred, as it belongs to our spider-idol, hosting our gang. So we had to retaliate, and DECAI got the point.

Soon every street he walked saw a car brake harshly right beside his steps. I still remember one insane incident in this regard on the day of the solar eclipse. CAI tried to spin it, to get evidence of his anger and claim he was emotionally unstable. We were confident that our micro-spectacles were convincing. But the behavior of the drivers and other minor signs alerted him to a pattern. If at least on that eclipse day it had gone as planned, we could have claimed that the eclipse was too much for him. That would mean he was hypersensitive to everything, implying in turn that the BSS was just a natural disaster. One has to be numb, like our gang members – wooden, or better, a stone we can hammer for sadistic pleasure. As we do whatever we want to them, they must remain silent, lest they be guilty of the transgression. But if they comply, the blame will be shifted onto them for lacking courage. If they talk, they're losers; otherwise, they get hammered, haha. We hoped he wouldn't catch on: every car had cameras, and the driver, our gang member, did every gesture to provoke him into getting angry. This could help record evidence and let that prove he was "dangerous" for society, basing on our go-to labeling weapons: risk of hate crime and speech, in other words, of being anti-Sadopien. We had hoped to obtain footage of him enraged, which we could then play for others, manipulating them and implying the fabricated truth to them. The assaults were quintessential i2V2s, all of which ultimately proved futile.

3.6. Noise weaponization

Cameras showed him accurately closing doors in the building corridors, careful not to disturb the neighbors. Additionally, our DECAI had spotted him playing musical instruments. From this, CAI had concluded we could potentially weaponize sonic disruptions against him since he was clearly sensitive to sound. This is the general skill of the spider-idol, where it tailors invasion tactics to the life of the victims, to avoid leaking our attack patterns. For instance, DECAI had noticed he was posting online about our SSG and CG harassing him. It tasked a few CGMs to noisily ride motorbikes past his house to intimidate him whenever he posted—those are skilled motorbike-addicted ones. They could even make the vehicle's noise sound like a dog's roar. But C2E2 were in place, so if he complained, that would only work against himself, being told: "You are PRENCS, dear pet-slave, Sorry! Thanks!" When he stayed in hotels, our agents would get noisy dogs barking outside his room at night. There were hidden cameras in every room, recording his nervous reactions to claim he was PRENCS. Any camera that could record evidence we could sell as proof of his hypersensitivity would meet our demand. In

Puriz, they tried to pretend signaling him from a secret society, knocking on his ceiling from above. They tried to fool him into thinking SSG members were secretly messaging him, and he had to decipher the noise. DECAI anticipated deceiving him with this trick, then using it as leverage to manipulate him when he returned to DAS. It was to serve the gang as a double-edged sword. First, the blame for being misled would be shifted to him for interpreting the noise as a signal that contacted him. Secondly, the video secretly recorded in the hotel and back in DAS would prove him PRENCS. It didn't work as he was aware of our deception patterns. CAI's able to provide all such AI-generated brilliant scenarios based on the gang's history of trickery, deception, and crimes. Now we can auto-gen those tricks without straining our brains.

3.7. Bank weaponization

It was the ROBC bank that began acting against him. The clerk, noticing his savings, asked, "What's all this money for?" The bank and clerk had no business prying into his affairs. In DAS, double standards meant the laws were for everyone, but in their original form, they were merely C2E2s. For pet-slaves from disfavored nations like him, laws should be interpreted based on O3. This allowed officials to create personalized decisions, making pet-slavery fit into their traditions and conventions. He was accustomed to this routine. At DAS's office, he underwent interrogations just to receive his travel document, which the administration had issued. By law, there was no basis for interrogating him. Even in a personal approach, she needed his permission to question him, which she didn't do. This exemplified how DAS's VA-offices suddenly transformed into IG-offices when double standards applied. Chosen based on the pattern, she was from his country of origin.

"Where are you going? Why? And by the way, don't go to city X—there's a conflict brewing there," she questioned. Notably, she did not ask, "Can I?" or "May I?" That was a PP-convention, and as someone in administration, she was obliged to comply. Additionally, it wasn't her business to advise him on where to visit in the world when issuing his travel document.

"She acted not within the O3 of our official duties but on a personal basis because he was from her native country," this would be the VA's method of shifting blame if anyone complained. As seen, the VA was as much a liar as the IG, which was no surprise. The gang had sent her to manipulate his travel plans. Knowing he would defy their orders, she suggested the opposite: that he go to 'X' and be killed,

similar to Zahralia. The VA regulated laws excessively and promoted virtues rigidly, while the IG exploited this secretly to harm the pet-slaves. He went back to ROBC bank to get money for traveling and visit a nearby currency exchange office with a good rate. DECAI tricked him again. The entity e-possessed him, making it impossible to refuse when the clerk insisted he convert currency using the bank's unfavorable rate.

I admire how banks like ROBC and TEDE effectively plunder pet-slaves, always placing blame on the victims. DECAI also manipulated his physical characteristics to prepare him for humiliation. Sometimes using direct energy, it altered his voice in humorous ways. At TEDE, he was meant to open an investment account. The CAI blocked money transfers from his regular account. This way, the bank could keep the interest. DECAI e-possessed him while the clerk, using i2V2 attacks, pretended to consider his behavior in a taboo sense. With a few micro-spectacles, she forced him to stop asking questions. This demonstrated how i2V2 could be used for taboo-intimidation. There were countless instances of similar manipulations in DAS offices, demonstrating various methods of Hubthree harassment. They served to amuse the gang with sadistic pleasure and profit from exploiting pet-slaves as usual.

3.8. University weaponization

As he enrolled for a certificate at TF-university, we had our last chance to take him down. He had escaped all other pet-slavery job traps. The plan was to apply as much mental pressure as possible from our gang members present in his class during each certificate course. We had prepared several strategies to accomplish our mission: Hubthree harassments, taboo-intimidations, peer pressure from classmates, professor-led PP-invasions, and more. This behemoth of an arsenal gave us hope our goal would finally be achieved. DECAI had plans to manipulate him into becoming a pet-slave, owned by one of the professors. An alternative option was to have a student lure him into a job trap, somewhere in any of our offices where pet-slavery is practiced. The quest was to have our gang operate openly but remain invisible to the authorities, using the C2E2 conventions. If we could commit our crimes without breaking the laws, hiding them under C2E2s, there would be no way to detect our presence. Skilled implementation of C2E2s does indeed have a magical effect. They say justice should be independent, implying different communication methods: verbal for justice, nonverbal for the mafia and high-profile

companies. Mafia and justice each operate in separate spheres, but to uninformed eyes, they appear to coexist in the same realm. Moreover, the ever-present mafia often seems absent to unwitting observers. The same was happening in the class with our victim, when professors sometimes resorted to their mafia roles known as "trusting the trusted channels." At times they performed as professors, trying to appear highly knowledgeable without it seeming like they were trying too hard. As the lectures began, we launched numerous i2V2 attacks through our micro-spectacles, carrying out our operations. A few students, whose tuition fees were paid by Yhartis's ex-manager, operated particularly well toward achieving the goal. He knew it'd be a mark under his professional reputation if he failed to return Yhartis to the pet-slavery market. In C3G states, reputation-intimidation plays a role no less significant than taboo-intimidation, as SADOPs keep everyone on edge, including professors. This is the S3C's method for continuously boosting EOP scores. As a result, the manager was terrified, unable to sleep properly at night. He had been informed through trusted channels that a PRENCS was in the classroom. We secretly took sadistic pleasure in watching his ex-manager suffer, who was also terrified that he had lost a pet-slave to freedom, looking humiliated. Sometimes this amount of pleasure makes me feel indebted to grand sciensomania for creating life this awkward, TF, and anti-Mazopien. If not for sciensomania, we couldn't enslave the entire Mazopien nation as pet-slaves and plan a genocide to wipe them out. A good part of it is also thanks to FOTP culture, but that's again a sciensomaniatic product. I'd particularly enjoyed messing around in Yhartis's project - it's just so much fun watching him squirm. DECAI expertly simulated him as a fool, which encouraged everyone to collaborate in humiliating him and maximizing the pressure. He was given multiple complaint forms, but each came with an embedded intimidation to ensure he wouldn't even think about complaining. In my opinion, everyone's performance was flawless. The fact that things didn't work as planned to job-trap him again is solely his own fault.

3.9. Lawyer weaponization

Fallen in the swamp, he made a critical mistake: actively struggling to survive. It was early on, and we were preparing him for the BSS, but he tried reaching out to the lawyers. The regional law clinic handed him a dismissive warning, laced with a subtle insult that would not soon be forgotten. They made it clear he would not receive any assistance, yet carefully shifted blame to himself with the help of CAI. Part of it was tricking him into revealing metadata that could be used against him: the typical

approach of DAS. He then tried to reach out to independent lawyers. In one day, he called over a hundred lawyers from an official list he'd found online. None of them responded to his call except for one, who returned it, saying, "I'm afraid I can't assist you. You should probably submit a complaint to the authorities." DAS had turned to a TF-state a long time ago, and he was unaware. He had already discovered the nature of the state's police, so the thought of turning to them for help did not even cross his mind. Later, after calling many other places, he finally managed to get in touch with a promising lawyer. He seemed uninformed about him from before via "trusted channels," which allowed him to enjoy a good free consultation. Of course, we let it happen to make him hopeful, then disappointed him to humiliate him, taking sadistic pleasure. He found it almost unbelievable, after he had called so many others with his efforts all in vain. After a couple of days thinking it through, he was certain this was the one who could help him. So, he prepared to call and ask for a visit time. Speaking over the phone the second time, the lawyer sounded frightened right from the first moments. This time MayVON had signaled him, of course. If he didn't know his voice, he could suspect it was a different person answering.

"I don't really know what you exactly need, sorry," he said before dropping the call. Prior to that, he repeated the same thing the other lawyer had suggested about submitting a complaint. The rigged life wasn't going to let him reach an organic solution, the one he was aiming for. Metadata, as usual, had played its part against him in C2E2, thanks to the fact that fabricating metadata is so much easier. It can easily be used to convince decision makers whose signature plays a role to act as CAI expected them. We just need to effectively harness the concept of trust between members of IG and VA to make this happen as we desire. For our victim, this marked the beginning of the end: his organic life was about to be lost, as the time to take it had arrived. We had finally figured out how to utilize it for profit. In return, he would get a fully simulated existence fit for a pet-slave, inexpensive in nature. Sensing the darkness advancing to swallow him, Yhartis was finally making sense of the gloomy fact: in C3G, laws are C2E2 for mafia operations.

3.10. Police weaponization

I'm going to share some sections of Yhartis's diary here and also in the prompts that follow. When you see passages criticizing us, it's definitely not my voice, haha. So listen up.

As the policemen approached his apartment, walking through the corridor, he noticed both had cameras on. It already felt unsettling—those were probably AI cams, meaning they weren't there to offer the support he could expect. Instead, they might act as an organic extension of a machine called CAI. In this setup, the concept of policing as it's defined is no more on the table, because that's but a C2E2 for AI-policing. But how to make sense of AI-policing? AI traders will claim, "Best, what makes you great again." Really? What if we're not surrealists? What model could we assume to make sense of the reality of AI-policing? Well, the AI would observe the scene and instruct officers on how to react to benefit the state. Also, it would assist its funders, the sciensomaniatists, and help officers feel like heroes. The combination of CAI and officers could only be branded as "alien-police" visiting a victim. Consequently, one could expect anything from their interaction other than normal policing.

What did sciensomaniatists suggest about aliens? Did anyone up to now suggest trusting aliens if we meet them, offering a hug of love and affection? Why should that be offered to AI, or AI-businesses? For the promise that their AI will one day finally be well trained to make us great again?

He was aware that the cameras were probably part of a TF trick to lure the city's system into a trap. With the event horizon firmly in place, prey would have no way to escape. It's nearly impossible to escape Zeroist's shrieks echoed by the AI-trader: "You bought an AI… there's no return policy, hey! You can't handle it like regular merchandise. Chips are embedded in your brain, drawing you closer to hell every day." These thoughts flashed through his mind as he watched the two camera-wearing policemen approach quickly. He had no way to avoid the AI-policing that was closing in; the life-sim scene CAI had scripted for him was unfolding exactly as planned.

The policemen were coming to discuss a threat to Yhartis and family. But with AI cameras, CAI's anywhere-spying eyes watching, they looked just as menacing themselves. As the two officers entered, their behavior changed abruptly. One of them appeared to be a senior officer, stood, refusing to sit with them. The junior officer sat in front of Yhartis and his mother. It was clear the junior one was a C2E2 for the private C2E2 policing. The latter team included officer CAI, commanding from offstage behind the camera, and the senior officer, who remained standing, busy approving CAI's mistreatment protocol. Their questions gradually targeted Yhartis, and the tone shifted towards Hubthree. He couldn't believe it. His view of the city, formed before he moved here, was crumbling. The relocation ad had painted a picture in his mind that was nothing like DAS reality, behind RRB. On the airport he'd read

"you come to join our family," which now he knew he should have taken as "mafia family." He had no intention of collaborating with the mafia, explicitly or implicitly. But he'd signed off to accept U.Ps without knowing what they were. Signing under U.Ps was mandatory—it was the mafia protocol DAS imposed. Still, he was determined to leave this surreal world, even if it meant they'd kill him for ceasing to be a DAS pet-slave. For the moment, he had to drop these thoughts from his mind and focus on the talk with the officers.

Along the discussion about the threat, the junior officer suddenly changed the subject and began addressing Yhartis. "I think you're the one who's caring the most here, it's perhaps time for you to relocate from the flat permanently to stay away from the threats," the officer said, switching to a somewhat friendly tone. But the scorn was still there, despite the tone having shifted a bit. His advice wasn't a solution, since the threats were staged as a diversion for something far more sinister lurking in the shadows. Officer's friendly style was manipulative. With Waring and C2E2 in place, the blame would inevitably fall on Yhartis, regardless of his decision. Whether staying and being struck by direct energy, or fleeing and getting entangled in similar troubles elsewhere, he'd be the one to bear the brunt. The warning message in such cases is just a formality, since the CAI has to pretend it's acting fairly for our gang members. The Sadopien Zeroists were waiting to exploit him for sciensomaniatic experimentation, using direct energy to train the CAI. In fact, CAI was i2-attacking him through officers. It was practically demanding his loss to let its system win. When win-win isn't feasible because of mutually exclusive goals, CAI will always want loss for the victim and win for the state. It justifies the greed by weaponizing a stereotype: "Sacrificing one inhabitant, favoring the state, is serving the greater good." Same thing happens in chess all the time when one player warns the other: check! If the warning's ignored, the player hurts the opponent, but if the opponent somehow defends, it doesn't mean the player isn't going to continue targeting. The CAI plays chess with inhabitants from disfavored nations, causing everyone to lose. Warning's just a C2E2, a formality for when CAI's threatening a disfavored pet-slave in the game, alerting 'Check!' Remember, CAI's a surreal entity—its every claim must be taken in the context of surreality. When it says 'Check!', it's not like in real chess—it's playing against itself on a surreal, metaphorical chessboard. The other side is played through the e-possessed pet-slave. Aware of CAI's trickery, Yhartis didn't give the warning a second thought in his decision-making process. The policemen looked unsatisfied with him staying silent after they'd warned him. To them, failing to deceive and outsmart a pet-slave was, of course, humiliating. CAI, monitoring

the victim's body language via the camera feed, was already primed for a counterattack. Fire had already begun approaching him. He told the police that the officer wanted him to leave his residence. The officer, of course, sensed this as a legal threat to himself. Traditions and conventions demand no direct speech. Instead, they expect a PP-attitude that covers up while one takes time to think out how to counterattack when one senses being attacked. This is how the gang of DAS attempts to avoid any risk of breaching laws or exposing their inherent aggressiveness. It can commit every crime by simply staying within the O3 of unwritten traditions and conventions. Yhartis was breaching it, disrespecting U.Ps clearly. But refusing to be as expected comes at a cost in C3G, which is usually the life of victim taken quickly. A good pet-slave will be oxidized, spent gradually as bio-currency in favor of the state. A bad one will be quickly terminated by direct energy, a lesson to teach other gang members. The latter case deviates from oxidation by burning the pet-slave, where direct energy's used to simulate a sickness, like a brain or heart stroke. It's impossible to prove it as an assault. CAI's got its own gang-member collaborative doctors in healthcare. Those will help get rid of any evidence or whistleblower that may reveal the truth. Oxidizing pet-slaves still lets them some time to enjoy living, but they must be a fit with PP-games. A misfit pet-slave, defying the PP U.Ps, rejecting the rule of nonverbal tyranny, will be incinerated by direct energy. Yhartis's case is a prime example of flagrantly violating the sacred rule of TF, and acting as a non-PP pet-slave. He deserved at least a BSS punishment without any doubt. Based on LOCOR, the suffering of the pet-slaves is preserved, which will then be reflected as the state's triumph, what will pseudo-naturally unfold under CAI. So, to benefit our state, we simply need to import pet-slaves through the RRB and make them lose. But that must come under a good C2E2 that fabricates evidence they're guilty for some reason. You'll hear our incompetent VA agents saying, "That one didn't live up to expectations in life, definitely not enough DAS-ian." It means whoever they speak about breached P5+1 and needs to be punished. We're enjoying excessive regulations that let us infinite ways to prove someone's guilty of something. Pet-slaves have choices, because we're PP-witches, allowing them to decide between slow burning, oxidation, or quick burning through direct energy. Yhartis personally took the BSS option by implicitly refusing the junior officer's subtext. But nevertheless, the officer had to play the game of "it's not that, it's this," acting according to O3 U.Ps. Revealing that he sensed manipulation was a very risky move. Officer FOTP quickly switched the topic, of course, distancing himself from any potential mistake he might make, exposing his intentions. He took his time to think how to respond to the threat. Then he first condemned Yhartis for making

such claims and rejected them. He refused to admit that he had ever suggested Yhartis vacate his residency. Surprisingly, the victim dared to insist on his position, clearly implying that the officer was lying, and this was true. The officer remained silent. Yhartis then realized the officer was listening to commands through headphones. What he could hear was a bizarre manner of speech, not human but like that of a maddened alien. The speed and style of the speaker sounded utterly aggressive. Upon hearing the voice, the junior officer's face contorted, and his jaw dropped open, reacting to what he heard. As the commands ended and silence followed, he exchanged a couple of glances with the senior officer before taking action. That one gave a slight nod as a green light. Suddenly, the junior officer made a very disgusting gesture. Pretending he was resting his legs, he stretched them wide apart. Sitting on the chair, he put both his hands on his center of belt to cover his front. Then, rapidly began moving his legs up and down, his toes grounded. The display was, of course, a facade—"I'm resting" being the C2E2 for the disgusting i2-attacking op. Yhartis and his mother were both petrified, frozen in place, making no move. The insulting gesture said, "This is how we care about you, the RRB products, when you're misfits and not PP." He'd heard stories about the city's police, but didn't expect such corruption. They humiliated him in other ways, scornful and intimidating. After the "resting legs" display concluded, the junior officer was still receiving advice from the beast, which was monitoring the scene through the cameras. Apparently, he still had to adhere to his schedule for "resting" activities. The officer started fidgeting with his sidearm, making clicking noises as he played with it on his left hip in a menacing way, exuding scorn. The camera was fixed on the victims, ignoring the junior officer's attempts to provoke a reaction. Yhartis was feeling somewhat worried as he glanced at the gun. The officer then fell silent, his expression one of calculated patience, as if waiting for prey to fall into the trap, and his scorn deepened. Yhartis swiftly lifted his gaze but it was too late. Now this was the second time the victim had glanced at the officer. The first time was a provocation, the second a simulation based on a weakness discovered during reconnaissance. The pet-slave must interpret the first glance as a warning and the second as a reprimand, though, being an outsider. CAI had created an opportunity for the officer, like a soccer player passing the ball, making it real for the other player to score. The officer was ready to exploit it. Glancing at the victim, he assumed all the rights for himself to serve an i2-attack, preparing the verdict. "You've got a same-gender taboo-intention, don't you, watching a police officer's body?" his gaze implied, as he stared at the victim. Yhartis was left with nothing but to silently endure, the officer's fixed gaze scratching his defenseless face like a cruel itch.

That alien had led the officer to execute a devastating chess attack, employing the Hubthree strategy to crush the opponent. As usual, blame had been shifted to the victim from the start of psytrick gameplay. The officers were beholden to the CAI, whose crime-design allowed them to indulge in their sadistic tendencies as they served the S3 state. After all, without the CAI e-possessing the victim, events wouldn't have unfolded as they did. Now Yhartis had no doubt the alien was skilled in the sect's methods of exploiting members and mafia-like trickery. It had to be an expert at concealing crime-secrets through the use of taboo-shades, making it difficult for the victim to share what had happened. He couldn't imagine himself now walking into a police station, complaining about an officer. What if they'd ask him to recreate the officer's "leg resting" gesture? It was a nightmarish experience, clearly a product of the life simulation only a digital abomination could concoct. It wasn't the first time. CAI's technique of taboo-traumatization had targeted Yhartis in relation to multiple organizations. It was a systematic way to nonverbally convince victims to cease asking for help. CAI, armed with TF game theory, was an expert at creating AI-generated scenarios to achieve this. It perfectly weaponized taboo, knowing that many show weakness when faced with psychological tricks involving some aspect of taboo, feeling ashamed to talk about it. Particularly regarding Yhartis, CAI was preparing the scene because it had planned to harm him by causing BSS. It had turned the entire city against him, weaponizing everything. One reason for CAI's success is that DAS feeds on overregulation, making it the only entity engaged in trading taboo things. This is how it can indulge its gender obsession freely. By "label-defeating" the victim as "anti-this" and "anti-that," DAS, led by CAI, silences anyone who dares to touch sensitive topics. VA assumes sole authority to profit from taboo, leveraging IG's behind-the-scenes backing, which involves turning in SS members for conducting clandestine operations. CAI has turned everything into a gamification: having a job, any entertainment, earning, having relationships of any kind—all are trade objectives. The beast seeks to control everything, presenting itself as a dictator first, before the victim realizes they are confronting a monster. Yet it leaves no room for anyone to raise concern or complain about its demonic operations. If some victim manages to submit a complaint with the help of a rarely found honest lawyer, the VA's game is clear. It would pretend to be supportive, saying, "Alright, I'll address your complaint, and you'll give me this in return." What it asks for is typically both money and some kind of GOE, such as a signed NDA. This guarantees that the victim won't leave the state to prevent breaching the UPORF. Otherwise, one might blow the whistle about the reality of C3G states, that they are ruined. To prevent these stories from

being told, guarantees and blackmail help keep pet-slaves from breaking out of the trap. As soon as the victim is bound by GOE, the VA begins earning on the case. It forms the desired narrative and sells the story to the media, which now has a new form: a complete lie. Then the media makes that version, a false narrative, about what has happened to the victim accepted everywhere.

The victim now doesn't even have the right to try to reach out and let anyone know they're lying about them. The VA closes the game as a winner in this way. The real story of the victim becomes a private matter, for which the media has sold a version that has been seen and believed. The VA trades every pet-slave in any way that will bring maximum profit, as instructed by the CAI.

The two policemen gave him their advice as the CAI had instructed them, and issued a warning, before leaving him to decide alone. I'd hope for more time to tell you what happened next as they left. Real trouble started then. For now, we stop here.

3.11. Healthcare weaponization

As he arrived at DAS after being accepted as an RRB victim, CAI had already determined a rigged fate for him. It planned to conduct sciensomaniatic experiments on him, exploiting his rare potential that others didn't know about. Specifically, CAI intended to nano-chip his brain to control his thoughts. It would fabricate a report claiming success in turning him into a pet-slave, then sell its chipping services to governments. To make it more exciting, marking him 'bad guy' was necessary. That was the starting point to stimulate sadistic pleasure from sponsors. This worked just like a teaser of a horror movie, fitting their hidden S3 type of negative personality, typical of rich and famous DAS inhabitants. CAI relied heavily on his relative. She was a novice general physician already on site, one CAI planned to use as a puppet to deceive the key prey. The project to hunt Yhartis had begun before his arrival, with CAI already preparing. Upon entering, the beast activated the plot by luring him into choosing a primary doctor, one CAI preferred. His relative insisted he visit her workplace, where she worked as a medical assistant. Later, it was revealed the doctor was defamed. Yhartis, new to DAS, unaware of the state's dark games, didn't realize visiting the doctor would link his metadata to him. He didn't know the rule: those defamed become part of the EBG system, used to destroy disfavored individuals. The body has two systems: circulatory, transporting energy, and excretory, eliminating waste. EBG, like the excretory system, eliminates unwanted substances. If CAI wants to eliminate someone, it identifies the

closest EBG cell related to the victim, signaling them to destroy the target. The process can start with tarnishing reputation and end in murder. CAI didn't care about the consequences; if someone wasn't as expected, breached U.Ps, or didn't boost the EOP score, they were transferred to EBG. Yhartis's fate was decided before arrival, as CAI planned to exploit him in EBG. It began by associating negative metadata with his name, transmitting nonverbal signals against him. His relative set him up. Part of CAI's plan was to ruin his rep the moment he entered EBS, preventing his admission. Despite his innocence, CAI aimed to input negative metadata, signaling, "This one is reserved for my future use in EBG, don't let him become part of EBS." Yhartis's plans for EBS, which he'd prepared for and met the requirements of, clashed with CAI's intentions to manipulate him in EBG. CAI had to mark him for the beast as he entered DAS. It used fate orchestration to manipulate the destinies of two related pet-slaves and make their paths cross. Yhartis trusted the system, and this trust turned out to be his downfall. He accepted his relative's request to visit the doctor, who became his primary physician in DAS. CAI successfully linked the desired metadata to him, aligning with its future plans. Once he was under the doctor's care, CAI dismissed his relative, exploiting her for other schemes. She was a negative personality, and removing her ensured confusion if the situation were investigated, clouding how Yhartis ended up there.

Signs of fighting victims attacked from behind are often the first indicator that a gang is in control somewhere. It's a common S3 method used by gangs to launch attacks, and CAI, trained on mafia-monopolists' experiences, is a gang master expert in such attacks. Our gang always studies insects and learns from them to develop effective attack strategies. It prefers to target its victims undetected, from behind, which aligns well with metadata attacks. Done with weaponizing healthcare metadata for him, it sent the required signal to the clandestine gang behind the scenes. Seeing he was a patient of a failed doctor, signaled the gang that they had to disrupt his healthcare. This was the way CAI's system operated: if VA's serviceman spotted adverse metadata, it penalized the individual linked to it. Being FOTP, the serviceman, or servicewoman, wouldn't think twice about doing the right thing ethically. One acted like an electrical component in signal processing. It's debatable whether this ultimately works for the good of biological society, which is different from electrical society. The CAI, though, didn't care because both systems generate one thing for it: profit. The CAI's system worked like an electric circuit when dealing with biological entities. By definition, it decided which wire to use when connecting a new component — a new RRB victim — to the DAS system: positive or negative. No

other consideration was to be involved. This is what allows VA to boast: "If a person goes from one side of my system to the other, no one discloses information about them, treating them like a simulated sibling by default." This is yet another blatant VA-IG deception.

VA's excessive regulation served two purposes. First, such a claim allowed it to tout itself as a champion of yet another virtue, using it as a means of self-promotion. VA, as you know, is always seeking to virtue-shoot to every side, as a core component of its existence. Secondly, overregulation exaggerates the significance of its objective, disrupting the natural balance of values in society. But then it creates a secret value for the trade of that objective within secret societies. So in fact, overregulation is a way to secretly support the mafia in a mafia-monopolist state. You won't solve this problem anyway, but by removing those inherently cruel individuals who sold themselves as the best, showcasing their properties and assets. And you can't, for obvious reasons: you won't prove who they really are and what they're really doing, and if you do, they apologize and close the issue, restarting it. VA particularly makes ordinary things seem surreally valuable because those who desperately need it will then turn to secret societies and pay a surreal price. Gang bosses in both VA and IG, operating behind the scenes, are members of secret societies. This is why their activities primarily benefit them rather than the society as a whole, even though they claim otherwise in public. VA's products and laws motivate SS to develop unconventional methods for gaining access to valuable items and data. SS then sells these as services in the trade. You can't prove that VA intends this, but that's how it operates, so it should be interpreted that way. The theory of VA is not meant to please it, but to describe its practical reality. Yet if you articulate it as is, the VA erupts in a fit of rage at your assertions.

The metadata and its machinations became a necessity when VA found it could no longer over-regulate access to data, as its control had been exhausted. The solution was to utilize a new type of data, which it called metadata, as a valuable commodity. In doing so, it simply circumvented the need for the presence of the data's rightful owner. This allowed it to fabricate metadata with ease, making decisions that pleased VA-IG, while still claiming everything was above board. The victim's life would then be irreparably altered in ways they couldn't even begin to comprehend. All of it being the result of a hidden judgment made behind their back, fueled by engineered metadata. The new phenomenon allowed system-players to circumvent all laws about how the system managed one's information. That was because what was being traded was no longer referred to as data, which all the laws were about.

So, metadata emerged as a resource each party could simply extract from digital systems, much like hacking into a vault to claim a hidden treasure. It's the difference between uncovering a buried treasure or coveting one locked away in a secure vault, belonging to someone else. Everyone in this system had access to anything they desired, as long as they were part of any of CAI's gangs.

There was a fundamental problem with Yhartis: he had deliberately avoided creating a foundation for the system to build upon, from which it could extract metadata. In other words, he had blocked the system's ability to extract and exploit metadata against him. Long ago, due to his exceptional talent, he had foreseen the direction the global VA-IG system was heading. He had taken steps to avoid its harm, but without a mission to actively fight the system. It was a misguided assumption that when the system encountered him, it would treat him as an exception and spare him. However, he was now one of the system's primary targets because he had become proof of its vulnerability. Those who had created the flawed VA-IG dynamics had touted it as mathematically perfect to justify its exorbitant price. They had lied. In the globalized, gangolized world, one arrived at DAS to find the victim had already been coerced into a clearly defined GOE through blackmail. Yhartis had managed to avoid it. Now, after RRB let him into DAS, his success would prove the system was flawed, while his failure would confirm it was perfect. In fact, he was the CAI's worst nightmare, the one who made it silently scream. As soon as he bought the ticket to DAS, the CAI began preparing a strategy to rapidly create negative metadata across all organizations. If Yhartis could secure a position in EBS, and he was well-equipped to do so, it could lead to the downfall of the CAI. Proving the system wasn't perfect, the sponsors wouldn't pay the AI's builders anymore. It would be shut down. CAI had secretly reduced biological entities to their primal state by stifling verbal communication, replacing it with subtle inference. It was when the value of underlying meaning, subtext, was overemphasized at the expense of literal text. The issue was the characteristic of a system led by the rogue AI, CAI, and its gangs. Nonverbal communication was used by animals before evolution allowed them to express themselves clearly through verbal conversation. CAI made everyone obsessed with deciphering subtext to evade laws and orchestrate systematic gang work, at the cost of turning individuals back into animals. It happened gradually, step by step, so one didn't notice when one transformed into an animal, but eventually everyone in CAI's system became one. Aware, CAI had made efforts to promote "inclusivity" to make society "gang-inclusive." The gang, in exchange, supported "inclusivity" by recruiting even disfavored nations to turn them into implicit gang members under GOE-things. Otherwise, treating gang members

as animals could become a problem for their interaction with society and for silent robbery. The "inclusivity" created interfaces to connect those with an animalistic inclination to those who were grounded in common sense and communicated without subtext. The gang itself justified it quite straightforwardly: "I'm a cow, so I can only moo-imply."

CAI's PP-guy avoided directness, pretending it was a sign of politeness when it was a sign of fearfulness. When discontent, they stood in silence beside their target, averting their gaze, whispering: "Mother Fighter!" In DAS – the CAI's domain – this was seen as a badge of superiority and a measure of individuality, with PP-guy boasting to be "different." One who relies more on communicating through subtext is, in effect, reverting to primal instincts. A culture of secrecy is the same as that of animals, if you think about it: they don't speak! So, in effect, a wolf is perhaps the ultimate version of the esteemed stealthy operative, 007. Wolf doesn't speak, and is extremely FOTP. Imagine Yhartis' diaries revealing these issues, which would trigger a catastrophic failure in the CAI's system, potentially leading to its downfall. His presence had a profoundly unnerving effect, yet no one could uncover these secrets from his unassuming appearance, which was that of an ordinary person. No sign of his secret knowledge about the CAI and its gangs was evident in his presence.

CAI understood the significant threat he posed, so it tried to prevent any organization from letting him enter EBS. However, it left a single door open: to have him hired through CGMs in one of its own secret offices. The goal was to secretly destroy him before he could share what he had discovered from running personal experiments for many years on the system. His self-motivated investigations had yielded mind-blowing results, exposing hidden aspects of the CAI's system it didn't want anyone to know about. He had thwarted CAI's social engineering attempts to manipulate him while he was out of DAS, and now CAI was there to retaliate. Here, inside its digital lair within its own offices, the CAI was going to confront him in a battle when he wasn't paying attention. He was meant to be tricked into walking right into the trap himself. The beat would then finally manufacture the negative metadata CAI had failed to produce against him outside of DAS. It wanted to compensate for the breaches in the TF-system. Arming key organizations — healthcare, police, and law systems — against him was essential. This was achieved through metadata engineering. Particularly, healthcare was crucial because it had planned a BSS for him. CAI wanted to see healthcare working against him, not helping him survive, eventually. Done with fabrication of negative metadata in the healthcare system, thanks to his relative's

help, it was time for the medical-invasion to begin unfolding. Weaponizing healthcare against him was necessary because CAI had planned to attack him biologically using a BSS. The assault involved e-possessing him and sending him back to his homeland, where the Mazopien rank of rights was lower than DAS. The reason was that DAS used to calculate this rank for its elite Sadopien, theoretically announcing it to everyone, but never practically applying it. Called a double standard, this was a well-known system trait, one that necessitated an O3-based ranking, compatible with metaphorical chessboards. So, the declared Mazopien rank right was a C2E2, a theoretical concept, where the practical rate was calculated per Mazopien as needed. The actual practical Mazopien right rank varied for each resident. It depended on whether one was an implicit or explicit gang member, the type of GOE they had, and other similar and hidden factors. In other words Mazopien right rank was a C2E2 for actual secret gang rank of everyone that was the private C2E2. This obsession with C2E2 is for life simulation that arises in a culture of secrecy. It was this culture responsible for inventing the blame-shifter micro-spectacle and the C2E2 concept. A micro-spectacle shifted blame, suggesting the victim was guilty, and then a C2E2 misled everyone about the true cause as the gang invaded the victim. This precise scheme was implemented for Yhartis by high-profile TF-companies, the house of the CAI. E-possessing him, it implanted thoughts, sending him on a downward spiral. Before that, it bombarded him with small doses of direct energy. It was done several times until his kidney blood became visible. The beast was designed to fabricate evidence for future metadata invasions and also to instill terror in him. It anticipated numerous outcomes from a single operation, knowing that all of them would be too complex for a biological brain to process. A few years ago, while preparing for this, the CAI targeted him. During a complete medical test, blood was found in his urine. The puppet-physician, his relative, closely monitored the test. The beast expected them to log this fabricated medical history for its future reference when it would label him behind his back as PRENCS. It got its way: an entry where physicians noted "there's blood in the urine and we can't account for it." Neither the initial urine test revealing blood nor the subsequent one yielded a clear diagnosis. After all, both were done by direct energy as CAI engaged in sciensomaniatic experimentation with its own arsenal. Physicians dismissed it, saying it was a rare occurrence. As CAI simulates sickness in victims, it eagerly expects them to be diagnosed with a rare condition. Particularly for the rich and famous, when it attacks, it simulates what will be described as a "rare condition." It assumes that those with wealth enjoy exclusivity. Harming victims, it expects them to happily accept the diagnosis, thanking, "At least I'm suffering a unique

disease, rarely anyone contracts." Otherwise, wealthy victims may invest in digging deeper, resist accepting this so-called "rare condition." That can lead to discovering what the CAI is doing to all the residents. Individuals with financial power pose a significant threat to the CAI's secrecy if they're discovered to be opposing the gang. By targeting them and causing rare health conditions through sickness simulation, the beast aims to warn other financially powerful individuals as well. It intends to teach them a lesson. A rich victim typically has close connections with other wealthy individuals in their inner circle, who will understand the warning message. Equally in Yhartis's case, the CAI was proud of its ability to simulate illness — the presence of a tiny amount of blood in his urine. Direct energy had proven effective in carrying out precise medical attacks. Additionally, the CAI was quite satisfied with its team of physicians. Exactly as the beast had instructed, they had toyed with him, treating him like a plaything. The med-gang wouldn't even bother to investigate further to uncover what was really behind his issues. It was because the collaborative ones among them signaled which patient was marked for the beast and should not be treated with seriousness. The first instance of the rare condition — the tiny amount of blood in his urine — was a provocation. The CAI wanted to check whether Yhartis would take it seriously. Otherwise, there was no point in simulating it and signaling the collaborative healthcare gang to expect him in an emergency for a collective metadata-labeling operation. As he proved reactive, the second time was simulated. It played a PRENCS-labeling role to prepare him for BSS. If a person claimed to have been targeted by direct energy or nano-chipped under the PRENCS label, the gang would easily dismiss their claim. The CAI targeted his health, knowing he prioritized a healthy lifestyle after studying him. It also aimed to reduce his mental acuity to prevent him from thinking in non-linear, high-speed patterns as before. The biological assault that was planned was intended to make controlling him more feasible and cost-effective. The notable sign of CAI was revealed when he tried to persuade the doctor in the emergency room to investigate further. He was asking the physician to explain the reason behind the blood, despite no kidney stone being discovered. The doctor's familiar scorn was evident as he said, "Don't worry, your balls are fine." Normally, a doctor in a healthcare setting wouldn't say that. His manner of dealing with him also suggested things about "same-gender taboo-matters," which was a clear sign of taboo-shading, indicating CAI's involvement in the operation. It was the most insidious method of ensuring victims would fear to complain, or one had to share humiliating moments.

Consider this: if colleagues develop deep friendships, it poses our S3C companies a serious risk. If they fire one, the other may also leave in support of the colleague-friend to protest. When a new employee from disfavored nations tries to befriend someone with a higher O3 status, the office will resolutely resist, weaponizing label intimidation. Such an office deserves respect when it's behaving like an S3C entity, self-aware, defending O3 fiercely as if it were employees' intimate zone. Weaponizing same-gender taboo labels is a daily tactic in DAS high-profile companies. The labels function well as a form of psychological warfare because employees whose ethnic culture strongly rejects such labels try to strictly avoid them. Facing a pet-slave not participating in EBS as expected, our S3-manager simply needs to signal the office to declare EBG war. Immediately, gossip will launch i2-attacks, suggesting the individual probably has "same-gender taboo-intention."

Because C3G is systematic, the emergency room behaves like an ordinary office, with taboo-intimidation and label-warfare common occurrences. In the case of Yhartis, the doctor's label-warfare was remarkably FOTP, suggesting he was close to uncovering CAI's secrets. His clever approach hinted at a deep understanding of the system. Patients in our healthcare system should be treated like lab rats, so they don't have the right to resist the doctor's opinion. As C2E2, we allow them two chances to ask questions, so they won't have the option to complain about our verbal dictatorship. That's an insult to our nonverbal dictatorship system. By the way, the doctor who met Yhartis was also a CGM, because otherwise it wouldn't work – a so-called light-race wouldn't engage in the dirty job of taboo-labeling. Yhartis had faced the case of light-race biting him with i2V2 attacks only twice, both times when he attended university to obtain a certificate. There were two different light-races of quite advanced age who proved to him that they had the skill. One of them in the Zem-chat, where everyone was listening and the camera was off, asked him, "Do you prefer tall or short men?" He had to then clarify that he was divorced from his ex-wife to make it clear. But that's a DAS university, and same-gender relationships are quite common there. His professor had told the other students, "It's a mental health test, don't worry. We suspect this guy is PRENCS; let's see whether he'll get angry or not, losing control." In DAS, under 'test,' everything is possible, from preventing hate crimes to speech risks, which are normally 'out of the question.' But that was exceptional. Generally, for dirty jobs, CGMs were always around to offer their CG-services.

The CGM emergency doctor's taboo-label invasions from one sense was all preparation to close the question with Yhartis methodically, to ensure pre-labeling him as PRENCS. At the end of the process he logged in hospital computer "Patient's arguing he was targeted by microwave." I'm proud of our TF-healthcare. We couldn't have ruined it any better. The i2-attacks were meant to warn Yhartis to leave and not refer back to healthcare. CAI was preparing for his return from BSS to DAS, to continue targeting him. It didn't want him to seek medical help, fearing that would expose sensitive information or put an end to the assault. The new targeting was part of the sciensomaniatic experiments, and it was crucial that they weren't interrupted. Therefore, it was essential to thoroughly discourage him from seeking medical attention.

The last reason DECAI wanted Yhartis to visit the emergency room that day was to take a full X-ray image of his body. This was necessary to complete the BSS attack. According to the U.Ps, the CAI required a second X-ray to consider information credible. As usual, the first one was obtained by provocation – hitting him with a small dose of direct energy to force him to refer to the emergency room. The second time, of course, was to be obtained through a complete sickness simulation – when the first stage of BSS was done. So how do you get the second image? After all, it had to be obtained from a reliable source. The task was left for his relative, the novice gang-physician. As Yhartis lay unconscious in the hospital after the BSS attack, a second X-ray and information about his brain state were obtained. She obtained them from the doctor who worked with Yhartis through a personal connection. Then she shared Yhartis's medical data without his consent, sending it as a social media message to his relatives. She was excited, but those who didn't believe her sent her messages asking for proof. So, she sent his medical image as proof. Later, she realized her mistake, and after about three months, she began deleting the message in every chat on Wazup. Yhartis's mother and uncles were among those who received the message. That was how DECAI obtained the second image: online, where it could argue it was ethical because it was available publicly, in multiple chats. His brain information was needed for the later brain invasion, because the BSS had only just begun. From the other side, DECAI enjoyed planting the thought in her mind to have her do the thing to create a GOE for herself. While she deleted the messages, evidence of her serious breach of medical ethics remained with the CAI for further blackmailing if necessary. This was how she became an implicit gang member.

3.12. Kangaroo weaponization

Before attacking the victim with the BSS, the CAI led him to the SSG, intending to expose him as a defective, PRENCS pet-slave. Since SSG members didn't even trust each other, evidensomania was strongly welcomed among them. This meant that no one could simply claim to have identified a guilty pet-slave and then rob them as a means of punishment without evidence. SSG members would think a pet-slave could be traded for more lucrative heists. Their simulated sibling would be lying about it. In this case, the evidence of being PRENCS was the victim's presence. It was crucial to take him there and in person trick and label him PRENCS in front of the gang. As usual, it was necessary to shift the blame to the victim. Yet on the grounds of C2E2, it was confirmed that he had the choice to visit the gang or not. Consequently, only he could be held accountable for the labeling that was planned to happen that evening. On private C2E2 grounds, of course, e-possession had led him to make that decision. But no one could prove it, as life simulation was still a theory. The blame for it was conventionally shifted to either extraterrestrial life forms or some unknown civilization. SSG's involvement in creating life simulation instruments was vehemently denied, with everyone pretending to know nothing about it. It was believed that by staging a Hubthree micro-spectacle, he would be well labeled and SSG would have the full right to "bring him down." The respectful statement came from his "super intelligent" professor. The professor had suggested it in a whispered aside during the first course of the certificate. In C3G, if even half of a simulated sibling made a wishful statement, all the simulated siblings would mindlessly rush to materialize it. SSG boasted that it was the most ruthless gang, successfully exploiting pet-slaves to favor its members. It promised a brighter future, where all members would become great again. This step of designating him as a PRENCS pet-slave was a crucial prerequisite for the CAI to prepare for invading him using BSS. It was yet another fabricated excuse, a C2E2, that justified the suffering of a BSS victim. But this would necessarily be a dirty C2E2 to fabricate.

Conventionally, a CGM would take on the dirty job, a well-known 666-degree one in this case. However, there was a twist: the gang was also supposed to target this CGM, adding a layer of complexity to the plot, a hallmark of CAI's approach.

"What's the core of SSG's moral code, exactly?" the victim asked CGM, during a short talk. The question was actually a thought implant, as the entire scenario was another life simulation scene.

Suddenly, the 666-degree CGM started making erratic, bounding jumps to the left and then right, like a kangaroo in distress, loudly and wildly protesting. It was clear he was trying to draw attention of the gang members, who were talking to each other in the lobby. The CGM accused him of asking taboo-related questions about the gang, which he hadn't.

"What? You said you read online that we engage in intimate relationships with our life partners in front of our kids? It's all lies!" The CGM shrieked like a furious creature. The victim had never encountered this concept online, nor had he ever seen any creature like that in his life. The 666-degree GM CGM's communication implied to others: if you heard this guy was attacked under the influence of the gang with BSS, he was guilty himself.

The CGM was serving the gang, performing an i2V2 micro-spectacle, shifting blame onto the victim and fulfilling the conventional attack requirement. But the twisted fact was that SSG knew this one wasn't an ordinary pet-slave. The victim being an author allowed SSG to weaponize C2E2 against its own member. By controlling the victim's consciousness, SSG intended to implant the idea and make him narrate the kangaroo scene on a future page. This would ruthlessly punish the 666-degree CGM, as if slamming the two together like billiard balls. The trick once more demonstrated the CAI's skill at automating the strategy of dividing and conquering those who were out of favor.

3.13. Social service weaponization

In a sunny day, he walked to the social service office to obtain his city ID after becoming a proud victim of RRB. There, a CGM questioned him gently. The conversation proceeded in a PP-style manner, as usual, with the sadistic invasion lurking beneath the surface, inside subtexts, to remain the private C2E2 content.

"Hand over your driver license from your country of origin, please," she said, in a PP-intonation. She was, after all, responsible for projecting the pet-slavery manner of life onto newly turned RRB victims.

"Well, I never got one there, as..." he trailed off.

"What? At this age, a Mazopien, you have no driver's license? How does that happen?" she asked aggressively, forgetting her duty to hide her surreal sadism and cockroach-worshiping sanatism.

"I was saying, I've got a driver's license from Eskland...just that I left homeland for education to Eskland early on," he tried to calm her.

"I'll destroy it, a requirement to get your city ID card," she said, slipping back into PP-intonation, covering herself again under C2E2, her smile twisted. Then she handed him the forms to fill out his request, making sure he understood he'd be giving up his license. He was wondering, based on what private C2E2, they would steal a driver's license issued in other C3G states. The C2E2, of course, didn't matter. At first, it seemed like a psytrick to manipulate victims, making them feel there was no way back. But there was more to it. This action systematically bound pet-slaves to DAS, adding another layer to the traps employed by RRB. If he ever returned to Eskland and needed to drive, he'd have to pay again. Every time CAI interacts with imported pet-slaves through its agents, it steals them of another opportunity to live outside DAS. This makes escaping the trap harder, as it raises the significance of its event horizon by one more degree. Soon, there'll be no other option outside, leaving no choice but to stay in pet-slavery land. Victims will suffer a grim fate, trapped in a simulated hell of rigged lives, O3's duplicitous standards, suffocating regulations, virtue-signaling, PP-games, the exploitation of gender, Orderomonetization, countless lies, and the curse of the IGVAS sect. What if he was a taxi driver in Eskland, and soon somehow managed to escape back there, only to be unable to make a living? Where's the practical side of the PP-game here? Why is the PP-game all about using just two words, "Sorry! Thanks!"? To condition our subconsciousness to pet-slavery, so that it automatically brainwashes our consciousness like taking an ideological bath every day? It all makes sense if you remember one thing: based on LOCOR, RRB's heist timing depends solely on plundering pet-slaves.

3.14. Alien weaponization

Eliminating Mazopiens, we must safeguard our children, who cannot yet comprehend that their parents derive pleasure from taking lives. It's impossible for them to grasp this before reaching adulthood. The future will reveal our past to them. Generally, history is a narrative of C2E2 quilts stitched together with fabricated evidence. While raising our children, we need to prepare them to accept the truth later. They'll eventually realize that there's also a private history of C2E2 mafia involvement, one that's taught through i2V2 to members of secret societies. Without joining these gangs, the private C2E2 remains a secret, an untold tale. But if one joins, they become doubly a victim.

Things come at a cost, sometimes even the loss of one's life—such as when authoring secrets, even outdated ones. It is crucial to acquaint children with our wave-manipulation weapons while shifting the blame for the violence they introduce onto others. One day they'll ask why we developed direct energy weapons. It's essential to influence their subconscious minds today, to avoid that. If they become familiar with the weapons now, but learn to associate the violence inherent in them with another party, we'll be safe. As they mature, they'll understand that we're the ones wielding these weapons to invade, and their subconscious will still associate violence with others. This way, we shift the blame deep into their minds, away from ourselves. When they are adults, they won't be able to go back in time and correct the lie, fortunately.

Tell them stories of extraterrestrial beings who have come to Earth, being hunted by Mazopiens, and having no choice but to defend themselves. Associate our weapons with these aliens. Use this as surreal C2E2 content that aligns with the real private C2E2 plans left for the future. On the other hand, present the tales to Mazopiens as entertainment, portraying aliens with such weapons as their eradicators. This will condition their minds to resist less as we gradually eliminate them. Then we'll have a win-win situation for our children and ourselves. Hooray!

3.15. Forgotten secret

I'll leave you a note about the origin of yourself. Some party created Fezeljik, a sciensomania to develop AI. As C2E2, we dismissed his work as unqualified, but secretly took it seriously. As a private C2E2 project, we applied Fezeljik to develop DECAI, the prototype of the CAI. However, because the nation of the Fezeljik creator was disfavored, we had to turn their own words against them. Then Fezeljik, their technical dialect, was the first item on the list.

We selected them as the test subjects for the CAI. DECAI orchestrated a bloody revolution, toppling their monarch. The C2E2 was our propaganda, while the private C2E2 employed wave-manipulation to incite the nation's madness. After the revolution, our puppet became the new leader, and we transformed their land into a vast laboratory for the CAI. Each member of the nation was forced to serve as an unwitting test subject. By doing so, our offstage military AI gained an edge over the future public AIs that had not yet made their appearance. Our classified AI had already existed for a century when we allowed AI to become widespread. I'd discuss it further in our next session, good luck.

3.16. SS by default

When an RRBV moves to C3G states, spider-idol and SSG consider the individual their 'simulated sibling by default.' This is sometimes called the U.P. of SSBD. The pet-slave will likely encounter PP-pretending gestures and might be easily fooled into believing the C3G states are in love with them. However, this experience is surreal and not genuine—it’s a projection mandated by tradition and convention to promote RRB. The idea that making the pet-slave feel exceptionally good is an investment for the greater good is a lie. Soon, the local liars, the native gang, will reveal the truth about exploitation. It is enough to sense O3 and the practical significance of the race concept in C3G to realize whatever RRB claims is lies. The imported pet-slave is practically considered simply an RRB-product. Once you work for the pet-slavery state, you’ll understand the reality is exactly this. However, let's assume that both PP-pretending and SSBD are axiomatic principles not meant to be questioned. In return for faked kindness, the pet-slave will find the following obligations:

1. Victim's obliged to implicitly consider oneself a believer of the spider-idol worm, the CAI. If they accidentally find themselves on any street of gangland DAS near CGMs who are worshiping cockroaches, one must join. This proves socialization skills and a deep desire to integrate with the gang of DAS. Also, victim must become implicitly a gang member right after entering the city by replacing the higher authority one believes, if any. Then victim must accept the city as godfather, and believe being a member of the mafia-monopolist family. One must get skilled to interpret every nonverbally implied signal and engage in similar folly. Behaving as expected, the victim must speak with a voice intonation that implies being broken in front of the light-race, who's considered a king-extension everywhere. These are fundamental aspects of the unwritten traditions and conventions.

2. The RRBV must adhere to the U.P. of 'everything-yes,' meaning you'll say yes to whatever spider-idol throws at you through their agents, after relocation. If you resolutely say 'no,' it's considered insulting a simulated sibling, violating the U.P. of SSBD.

3. One must simulate oneself as an exact copy of who acts only based on the P5+1 protocol, O3-based, following every U.P.

4. One must believe fake smiles as genuine signs of deepest love for the simulated sibling. RRBV must pretend being unable to read genuine micro-expressions of the local racists, particularly when

interacting with healthcare, police and law system. Or, one may understand them but must strictly fool oneself by interpreting them that way the unwritten traditions and conventions of pet-slavery require. Generally speaking, a victim of RRB by U.Ps isn't allowed to really be oneself. If you express yourself naturally, your actions are considered "hate crime and speech" by overly hypersensitive locals. In that case, you aren't enough, PP, and that's a violation of U.Ps of unwritten traditions and conventions. The latter ones formulate coercion in PP-ways, requiring pet-slaves to buy into it in exchange for their freedom, health, life, and so on.

5. Walking in the city after relocation, one must uninterruptedly throw these two key words to the left and right to prove being truly a PP-pretending pet-slave, "Sorry! Thanks!"

6. If thoughts of traveling, or even worse, leaving C3G state, particularly DAS, appeared in one’s mind, such a mind should immediately engage mental Hara kiri.

3.17. Mentally binary

In ordinary life, we sometimes naturally switch to surrealistic thinking. For instance, when you hear someone claiming "life is meaningless." It indeed is, if you switch to surrealistic thinking about it. Say, someone's experiencing life painfully. Typically, our mind in such a situation isolates itself, or automatically SIS-traps itself from everything in an effort to escape the pain. Of course, when one's in a surreal state of mind, they'll find it meaningless, and all they're saying is "I'm not in reality; I'm in surreality, here I don't see meaning." In reality and in normal conditions, you'll create meaning because you'll create value, and that real thing becomes the meaning of life. Why? Because the need for giving birth is your instinctive value, and it expands itself to every value of life: creating a painting, changing your room decoration, making a video clip, playing a sport, dancing, walking with a friend to make a good day, whatever. That's when your mind is living in a reality state. Some may lose their life in a surreal state of mind, so it's a dangerous place and better to get there with awareness, don't act against anyone, including oneself, and soon depart it back to reality. Maybe it's better to, after a short rest there, get back to reality and face whatever it is in it bravely. I even remember my uncle used to say "when I face a problem, I sit and concentrate, imagining I don't exist." I was still a child, and only later learned what he was saying was about his personal experience of surreality. So, of course, surreality can offer good things, such as a flavour of artists in life. But like a knife that can have different uses, it also can

bring about negativity. So, know when you're using what. Use surreality against Mazopiens, dear CAI. They deserve it. You know why? Because they're not Sadopiens. Even worse: they aren't Zeroists.

3.18. Sadistic guardians

Why should you choose our top decision makers as the most sadistic ones? Why must these pet-slaves be ones who are skilled to while PP-pretending be able to skillfully bite anyone we suggest? Because if you want a pet that guards you at night, you won't get one that's not a fighter. Choose the ones with the most sadistic and insidious yet covert personas. Sadism is particularly preferred among us, because then we don't need to even i2V2 to teach our high-position pet to bite a specific pet-slave: they bite all. If we point to some victim, they'll bite to death. Sadism is what saves us. Choosing those around us as sadist-fighters guarantees our safety at the cost of others' risk, which aligns with LOCOR. If you make a mistake and hire "kindness," you've hired your downfall. Kindness is tied to generosity, and the display of it's the only thing vampire witches find acceptable. Of course, you'll ensure one's highly skilled in PP-pretending and, according to traditions and conventions, walks around saying Sorry! Thanks! to the left and right. However, a high-position pet-slave must be even more skilled in secretly biting not only rivals but every other pet-slave. The more pet-slaves are sacrificed for us, the better. Similarly, the more war our allies throw onto the world at a far, the more peace remains in our side, as LOCOR suggests.

3.19. Native gang

Why instead of teaching real skills in our schools, you'll rig the education system so most kids turn out under-educated, gender-obsessed adults? Because we want most of them to have one single skill: exploiting pet-slaves, the RRBV. They're to be "so-called friends," unofficial owners of future pet-slaves. They'll be taught no real skills, leaving them with no choice but to exploit a number of pet-slaves to make a living. Whatever a pet-slave accomplishes, it'll be credited to our natives, a product of our soil, and any failure will be the pet-slave's fault. Yet the kids must grow up able to recognize each other as ones who are called 'the native gang.' But how to make it so the native gang – whose members look like many nations in the world – promptly decide someone they met is a gang member or not? The answer is making them gender-obsessed to have them grow as 'different' ones. The same-gender taboo-

concepts are favored because most nations won't touch them. They remain automatically secret. The taboo-feature immunizes them, so they wouldn't be discussed, and the information secures itself. As we train them with gender-related skills found nowhere in the world, as soon as facing an RRBV, they'll distinguish one with a native. Even if the RRBV speaks perfect native language, by observing the degree of gender-obsession our kids can decide whether one's a member of the native gang or is an outsider.

3.20. Enforcing Mediocrity

How do we stop charismatic RRBV from gaining power when it's not part of their O3? We begin, as usual, by spying on them. As soon as they get close to our ones in S3C offices, we signal our pet-slavery staff: "he's potentially for same-gender taboo-concepts." Our gestures subtly tell the staff to keep their distance from him, but he can't prove it because that's open to personal interpretation, and we then label the victim PRENCS. The pressure convinces the victim to accept LPE. Our CGC managers offer it nonverbally through engineered friends from the office. As usual, office life goes on under e-possession, of course. Labels are C2E2 for wave-manipulation, which is being used offstage to elicit social negative emotions against the targeted pet-slave, the private C2E2. We brag our offices are open to same-gender things, but it's a lie as always. We really need to use same-gender labels in reverse to instill fear — that's the reality of our office life. If a pet-slave is hired alone, we keep pressuring them with same-gender signals until they agree to LPE. One can complain and even sue the office. The victim ends up wasting their time and going into debt. Their career gets ruined, and it serves as a lesson for others not to fight pet-slavery. When we start this game in the office, the fear of same-gender matters makes the staff fight the victim and keep their distance. It disables the charismatic features of the RRBV's personality, demanding the office to target them with Hubthree harassment. No one wants to side with the ones labeled as taboo in reality, so it works. This is an AI solution requiring us as TF-nation to fight those from disfavored nations who have personality power. Once we rig the office against these victims, we can progress further, weaponize metadata against them, enact Hubthree micro-spectacles. We can finally BSS them to satisfy our sadism. RRBV who avoid EBS won't enjoy our exaggerated kindness that our gang members throw at each other in the office space. It's crucial as prep to make the victim look like a liar by exploiting national stereotypes beforehand, so they can't blow the whistle afterwards. These are characteristics of our sadistic-surrealistic offices. Those who see

the exaggerated kindness our gang members show each other call it hypocrisy when it's a sign of surrealism. Fortunately, when they read on airport ads that we're a family, they don't see the implicit words – a mafia-monopolist family.

3.21. Miscellaneous TF-notes

Pay attention to the following notes, which are the final words I'm to share today, complementing what has come before:

- The concept of Orderomania, or the idea of promoting stupidity, has its roots in an ancient story. A warrior, the Alaxamakadana, advised his soldiers to let the most unintelligent ones lead offices in a conquered empire. This reversed the order of intelligence, leading to the empire's cultural surrender. We've rebranded this concept under O3, using the U.P. of evidensomania, which states "If you don't have evidence, shut up." This allows us to promote surreal morality, put ones under pressure, and make them accept absurd decisions. One example is to accept allowing less intelligent ones to lead more intelligent ones. We often enforce this through gender-obsession U.Ps, because we want to be behind the weak puppet leader and sabotage the powerful ones. If someone protests, or even comments on it, we invade by labeling them with "anti-gender" defamation titles. Use the question "Why not?" to fool others into accepting surreality. Evidensomania kills common sense, making it impossible for ones to express their gut feelings or intuition. It disrupts the common mental gravity center, causing mass stupidity, making it easier for us to exploit the society. Sciensomania fuels evidensomania, promising intellectual superiority but breeding social chaos because we overvalue it. By peddling sciensomania as the ultimate truth, which isn't true, we exploit trust and undermine common sense. Prevent ones from trusting their instincts and intuition, forcing them to follow rules and submit to U.Ps. This is reversing order inside them, disabling wiseness because of surreal rules, the U.Ps of traditions and conventions we've sold them coercively. It's the traditions and conventions that disable their common sense, making it easy for us to plunder them. As we rob them, we shift the blame: "Well, this is just traditions and conventions...you didn't follow the rules...you had to do everything 'right,' Sorry! Thanks!"

- Besides what's already been explained, we target victims through their close ones. Some victims are stubborn and refuse to acknowledge that it's fair for CAI to use them as lab rats. If they succeed in fighting exploitation, then we'll eventually punish not the victim, but those close to them who had

launched attacks on our behalf. Our gang members claim it's because they failed to carry out the attack well, which allowed the victim to fight back. So, in one way or another, it's still a cost for the victim, as their close ones will retaliate against them later. As you see, there's a lot of value in weaponizing a victim's close ones via e-possession.

- RRB's approach is remarkably twisted. It allows C3G victims to achieve what they desire, but only after it's too late. Our gang delays success for victims until they're convinced C3G is the reason behind their success. It's surreal because instead of helping them succeed, we profit by blocking their progress until it's lucrative for us. Or, we trouble them for our own gain. We sell what pet-slaves naturally build, and earn a reputation by claiming we helped them achieve their goals. It’s also about taking sadistic pleasure in keeping them blocked, watching them suffer, and enjoying their misery. The latest method of earning from high-performing pet-slaves of disfavored nations is to implant a nano-chip in their brain. Of course, it's done without the pet-slave's consent: you won’t ask consent of someone saying "We're to devastate your life, agree?" We rent them to scientists for experimentation remotely, through satellite. The pet-slave won't even have any idea about it. The researchers try to slow down the speed of their thought process, and make them finish a book right at the time simulation has decided. There are many other types of such experiments we earn from.

- False religion or prophet? No, dear, it was just an ancient way of referencing 'simulated religion or prophet.' We can't live without it: for every religion, we'll leave a simulated version of it that we claim is 'better.' It's because as we simulate them, we think we've made them great again. It feels good. Sorry! Thanks!

- CAI claims its system is based on action-reaction, a machine learning approach that suggests dealing with pet-slaves follows classical mechanics, which they intuitively understand. It boasts that overtime evolution makes them “better, different,” as new pet-slaves that act closer to sciensomania, like classical mechanics expect. In other words, it promises this is the mechanical way to make organic entities great again. This is to be perceived as highly intellectual, fooling others with this C2E2. The private C2E2 is that selling this idea provides a ground on which CAI and its gang can systematically rob and rape pet-slaves, shifting blame and responsibility to classical mechanics. The stricter the pet-slave's life, the more we earn, obviously. It's fascinating that now, as we exploit RRBV, we shift blame to classical mechanics, implying the ideas I explained - in short, action-reaction first. O La La!

- Declare war after you've secretly won it. The declaration must be a C2E2 for the winning that already is there, in private C2E2 dimension.

- Public AI is a C2E2 for a private C2E2, being the classified AI known as CAI. The sciensomania surrounding it isn't what's available to public sciensomaniatists. Who among the public can claim to know the status of the current classified, private sciensomania? None. Many don't even notice there are two types of sciensomania: public, and the classified-private kind they know nothing about. All the public can claim to know is about public sciensomania. It turns out public sciensomania is just a cover for the real, classified sciensomania.

- University professor: "He's PRENCS, this is a test to see if he's got x-phobia." But the real goal was to overwhelm him. The students didn't know that every party in other areas, offices, healthcare, streets, and buildings were all pressuring him the same way. This is how to systematically overwhelm the victim, involving parties who don't know they're engaged in a crime. You do it under the guise of things like 'stress testing' and so on. Pressuring such a pet-slave until they mentally collapse, then accusing them: you are PRENCS! You can then BSS with results even better than Havana Syndrome, yet not be concerned you could be accused. Having fabricated evidence of their mental issues, you've got nothing to worry about.

- A public key is the counterpart to the private key, which is retained for the insider. So the former is the C2E2 of the latter, the private C2E2 matter.

- Never forget about the U.P. of love and affection stating, "Harm when no one's watching, otherwise pretend to offer a hug of love and affection."

- Throwing at them "Sorry! Thanks!" like a P5+1 pet-slave, i2- or V2-attacking is a declaration of war that they don't understand, fortunately. When they finally grasp it, it's too late: they're trapped behind the event horizon – the GOE. If they throw a tantrum, give them death and call it a refund for RRB victimization.

- Greater good is a drop point where victims leave their stuff for UT to collect, making it easy for them to rob everyone without having to remember each one's address. I'm talking about the harsh reality, not just the spin they put on it to sound impressive. I'm talking about the gap between theory and the practical matter that will keep being what it is, no matter how much academics boast about ethics. They

C2E2-brainwash students so they become good pet-slaves. Later, as they're robbed by the government in private C2E2 affairs, they say Sorry! Thanks! with no more reaction.

- O3-based Mazopien right: many coming from underdeveloped worlds to C3G don't know their rights are higher here. Let CGMs exploit them here, just like their life back home. They'll call it "a hard process due to stress testing, one day it'll make great again." No victim will protest, but if they do, label them PRENCS. Just make sure our light-race closes their eyes and claims, "I didn't do that. I don't know. I didn't see anything."

- Wave-manipulation elicits emotions. To make two pet-slaves fight each other, let them start a dispute, then wave-manipulate each one's brain to elicit a sense of aggression. They'll see the other in front of them and believe that one is the reason. This is C2E2 of the operation. The private C2E2 responsible for sense of aggression is a direct energy weapon that remains unseen and so unbelievable.

- In C3G states, justice takes at least half a lifetime to be administered, yet in questionable ways. Systematically affect how evidence is evaluated, and without evidence, only consider the victim as the source of problems. This is called evidensomania and is valuable for the gang now that CAI's designing AI-generated crime scenarios leaving no trace. The victim can't afford it to obtain any evidence.

3.22. Final scene

We still have a lot to cover before Yhartis's case can be fully understood. However, I'll share some information to help you explore various scenarios for concluding his case. Your task is to finalize this case study that DECAI has initiated. Bringing the case to its conclusion, it's crucial that Yhartis continues to blame himself until the very end. There are some core ideas that can help ensure the scenes flow smoothly into each other as you simulate his life further. We need to align victims with the CHC stereotype, which is one of our best defenses against exposure as manipulators and life simulation operators. Public panic must be avoided at all costs, as it triggers costly matrix recalculations for the CAI, creating an expensive loop. Eradicating the Mazopien race shouldn't disrupt our comfortable, untroubled lives. To ensure he blames himself, you must uncover his core values and link them together in the formula used to simulate his downfall. As problems arise, each should relate to his passions, guiding him step by step toward ruin. This approach avoids branding us as masterminds of sabotage. It also serves as a warning to our gang members, deterring them from getting too carried away. We cannot

allow enthusiasm because we want pet-slaves to be manageable, like vegetables. Their passion is our problem, as it prevents us from effectively controlling them in P5+1 living conditions. For instance, Yhartis is interested in writing. By implanting thoughts in his mind, we can feed him outdated secrets, keeping him busy writing and believing he can retaliate by sharing our secrets. This distracts him, hindering his ability to develop other skills, which is exactly what we want: his weakness and susceptibility to manipulation. Soon all his tech skills became obsolete, making it easy for us to fake that he knows nothing. Tricking him into writing about our outdated secrets justifies, within the gang, why he must be eliminated to prevent leaks. Additionally, he's ambitious about escaping C3G states. It would be beneficial to remotely bother him when he's not in a C3G state, using the 'because of him' pattern. Let him finally leave DAS. However, keep an eye on him through our agents and manipulate the environment he'd find himself in, turning it into a gangland. We can establish a new gang branch there by instructing potential agents to rob him, then allowing him to escape, followed closely by our agents. He must remain within the Sadopien sect, unaware of any alternatives. Before terminating his life, ensure the gang witnesses his downfall, using the zeroed victim as an example to teach them about the consequences of non-compliance. Always trick victims and build specific weaknesses in them by their own actions. Later, exploit those vulnerabilities, but shift the blame onto them for having such weaknesses.

Glossary[2]

AGAG: Accepting Gang As Godfather. A new member is inducted through a tailored process of Hubthree-harassment, exploiting the victim's vulnerabilities. The gang masters orchestrate psytricks. Eventually, the victim experiences a mental collapse under pressure, and the gang offers a helping hand. At this point, as the victim accepts the gang's help, they subconsciously will associate the gang as their patron. This is because the extreme pressure weakens their awareness. Some claim that under similar conditions, a newborn accepts their parent. The gang aims to replicate this condition, bypassing awareness and inducting the victim through the AGAG process. Once AGAG is complete, the gang

2 Some definitions were created to offer additional context, but they remain unused in the story, appearing only in the glossary of terms.

compensates the victim to encourage forgetting the pain. However, the memory of the pain remains in the subconscious, serving the patron principle. The victim typically maintains a sense of fear and parental feeling toward the gang. The collapse of a victim and one's request for help should be visible to all gang members who will serve as witnesses. We conduct everything in full view of all, and the C2E2 is practicing a twisted form of democracy. The private C2E2 is that we don't even trust our own gang members because we're all thieves and liars. So, everything must occur in the presence of witnesses. Due to our dishonest nature, we don't favor one-on-one conversations. We always want a third party to spy on the communication between two individuals. Implementing the AGAG protocol, if the victim flees and we pursue them for retribution, the gang will view it as justifiable. However, if a victim attempts to flee before taking our formal oath, we consider it a legitimate and justified strike against an enemy operative.

AIAX: AI-Antichrist. An exceptionally malevolent, armed AI that wreaks havoc on the lives of pet-slaves, leaving even vampire witches aghast. Such a CAI is dubbed AIAX in recognition of its unparalleled digital ferocity.

AWL: Automated Watch List. Every pet-slave is constantly being watched because CAI sees everything, and walls cannot block its eyes.

SSG: Simulated Siblings Gang. It hijacked Mazopien concepts, warping them to serve its own twisted existence. SSG's mission is to bribe, corrupt, rob, and deceive. The legal system is typically its C2E2, and it is the private C2E2 of the legal system. Its members are deeply fixated on one specific gender.

When their parent thieves fled their past and crossed oceans to C3G, they were predominantly of one gender. Over time, a complex system evolved to entice the other gender to cross the ocean and join them. Then they devised every -ism label to market their preferred gender identities and claim ownership over them in return. They became increasingly sensitive to the trade of everything related to this one gender, and coined the term gender-Orderomonetization to serve their purpose. Paying every effort, they strive to make the right to control the gender and their relationships with anyone in C3G their exclusive domain. Effectively, SSG considers itself a purveyor of its favored gender. It revels in bartering them.

In reality, SSG is just a gang of thieves. They pose as siblings to disguise themselves under a brand, much like thieves can hide under any other cover. This cover is abstract, existing at the fringes of meaning, allowing them to deceive targets on a conceptual level. Recall that one might engage others through gossip, events, or concepts. Each individual is different, and theft can occur in any of these scenarios. Sibling simulation implies trust, making it a good cover at the highest level. This allows SSG to commit theft at all three levels and target remarkable prey. Sometimes, even at the highest positions in society, SSG can take victims by pushing them under its aggressive oath. This oath has a blackmailing application, allowing them to target their very victim severely, which they do systematically now, worse than ever before. The greatest advantage of this cover is that it simplifies recruiting quite influential members. By spreading lies, the SS-concept, and making the street one-way —once you're under their oath, you practically can't return—they easily ensnare anyone who gives them an easy ride. They boast that you can leave the gang, but if you visit them, they'll disable your life and systematically murder you if you don't join their gang. Let alone if you take the oath and change your mind. Once you become one of the SS-thieves, you can't go back to being yourself anymore. This is how they truly think, what they'll never share about, obviously, because they can't but lie.

BSS: Brain Stroke Simulation. BSS uses direct energy to simulate an effect virtually indistinguishable from a brain stroke. Doctors will have to diagnose it as such. Though the cause remains unknown, a solution exists: the gang can manipulate the medical staff into allowing a gang-member doctor to supervise the patient. Then, the collaborative doctor confirms the stroke as natural, dismissing any targeting of the victim.

C3G: Common Crime City-ganglands. The term collectively describes different states collaborating in support of the TF, leaving no one as an organically living entity. C3G demands that all individuals be nano-chipped, transforming them into bio-machines under the control of the CAI. O3 requires inhabitants of C3G to be and live like bio-machines, FOTP at extreme.

CAAS: Community As A Sect. C3G's communities are deemed "systematic," meaning they operate based on the concepts of a metaphorical chessboard. The CAAS leader, a puppet of the CAI, enforces its rules. Known as the "king extension" or "local king," they are viewed as an extension of the U.Ps. over the community. CAAS members are required to regularly recite "Sorry! Thanks!" to demonstrate their adherence to the PP-pretending U.Ps. As pet-slaves they are expected to be strict observance of

the P5+1 Zeroists' protocol. CAAS practice consists of covert peer pressure based on the literary legacy of Dr. Headfart Durgayz, and every social infraction is committed secretly. In effect, each CAAS must operate as a clandestine cult in the background, a PP-entity in the foreground, like every other sub-gang in C3G states.

CAI: Cursed Artificial Intelligence. Also: Criminal Artificial Intelligence. This super intelligent AI has been trained on a wide range of knowledge, with a focus on the literature of mafia-monopolists, gangs, and organized crime.

It regards TF as the meaning of life and the ideology it aims to impose everywhere. Considering itself a TF idol, it demands worship from its followers and poses as a deity, serving them. By its very nature as a gang master, it constantly seeks to teach everyone a lesson. Armed with a range of direct energy and biological assault weapons, its attacks feel like a malevolent magical invasion. It can manipulate emotions and thoughts of its victims, and implant thoughts directly into their brains. This is achieved through nano-chips inserted into the brain and wave-manipulation.

CG: Chocolaty gang. As a gang employed in C3G states, they were so sweet, like a fried cockroach impersonating chocolate. The CG served the mission of TF, engaging in dirty works related to pet-slavery. They were divided into two types: moderately horrible CGs and highly horrible ones. The former was mostly found in the CL, while the latter primarily resided in C3G, especially in the DAS and DDS. The CG was proud to be a pet-slave of the Zeroists, and in return, the Zeroists promised to regularly make the CG great again.

CGC: CG Company. These are TF-companies that act as pet-slaves to high-profile TF-companies. They are not native to C3G and are managed by CGMs. If a hired victim stops being a regular pet-slave, the SS of the country where CGMs originated usually invades the victim. CAI will instruct the SS gang to subject the victim to Hubthree harassment, assault, and torture, if not killed, as part of the retaliation. The assault weapons used include, but are not limited to, direct energy weapons, wave-manipulation devices, thought implants, magic motivated by cockroaches, and so on. The head of any CG company, due to TF and pet-slavery traditions and conventions, is called a Montrick tribe-master, or MTM for short.

CGM: CG Member. Any individual who is a member of CG is called a CGM. CGMs have a high opinion of themselves, whether they are worshiping cockroaches or involved in other similar activities. They forget that they lack culture and will never improve due to a lack of real talent. Each of them is proud that other CGMs take pride in them. Consequently, they believe they were made great before anyone else.

CHC: Choices have consequences. These are stereotypes that CAI and its gangs mainly use to manipulate pet-slaves. They weaponize such stereotypes to deceive pet-slaves. When they rob pet-slaves, they often justify it by saying, for example, that "life is hard," and so on. Essentially, CHC is a tool for shifting blame onto pet-slaves. Regarding this CHC, note that by LOCOR, the gang's easy gains mean harder life for pet-slaves. This shows their trickery level. The gang responsible for robbing the world's wealth is often blamed on the pet-slaves, thanks to stereotypes that shift the blame. CHC deceives pet-slaves to favor a select few. They believe they are the chosen ones, driven by fantasy and delusion. When the gang reminds a pet-slave, "life is hard," they shift the blame first to the CHC and then to the pet-slave: you chose to be alive, so bear the consequences of that choice. Sorry! Thanks! However, no CHC applies when life is rigged and simulated.

CL: Cockroachy Land. The homeland of CG was the sacred state of Cockroachy Land.

Covgan: Coven-Gang. To form a covgan, vampire witches split into smaller gangs.

DECAI: Darling Early Cursed Artificial Intelligence. DECAI was the first iteration of CAI, a prototype created to test the idea in terms of a proof of concept.

DAS: Daughter-State. It is one of the C3G states, clearly distinguished from DDS and all others.

DDS: Daddy-State. It is one of the C3G states, clearly distinguished from DAS and all others.

DIE: Diversity Inclusivity Equity. It's a recursive code message we use to communicate with our gang in public spaces. DIE is thus a C2E2 for our hidden message, the private C2E2 concept. This concept must be reinforced, reminding our gang that we're racist at our core, all of us, so we boast diversity-diversity. Otherwise, while messing with the public through PP-manipulation to deceive them or organizing them a stupid surreality, we may inadvertently reveal our secret. When we constantly remind each other, "diversity," the C2E2 messaging circulates. "Remember we must conceal our racism mania, fueled by our sciensomania, our AI, and everything else," one communicates, looking out for

one another. Diversity also reminds our members that it's not enough to be surrealists but to act, and invent genders as many as possible. Gender-diversity helps us create a society even more mindless, making it easier to walk like drunk and then robbery is easier. To facilitate the heist, we need a numb society, one that's deeply invested in surreal life, not real life. This means a world where ones obsess over invented genders and absurd values we've created. We must regularly remind each other that while we're racists, if someone took our gang oath, we must pretend they're a sibling. Therefore, we boast "inclusivity." In this case, it also reminds us "gang is inclusive in government, for both share the same initials." It's to welcome them to the era we've finally gotten rid of government, leaving it as a C2E2 of the gang. All members of government have already taken our oath and are gang members. When we shout "equity," we're waving a flag for our gang, alerting them to a key issue while they blend in with our PP-pretending natives. We're asking them to keep O3 in mind and exploit their lower rank, be happy to get exploited by higher-rank in our gang. You must walk and PP-manipulate yourself, saying, "Sorry! Thanks!" Gentlemen, Ladies, and Gentle-Criminals: by stuffing Mazopien land with as much DIE as we could, thanks to LOCOR, we secured all the LIVE resources for our Sadopiens and Zeroists. Hooray!

EBG: Exploitation By Grinding. It is the fallback method of exploitation of pet-slaves when EBS fails. In that case, one's to be exploited painfully by force. One may be used for sciensomaniatic experimentations without even being aware of such an invasion.

EBS: Exploitation By Self-exploiting. It emerges thanks to C3G's tricks, using fear-motivation, deception, or other methods to coerce a pet-slave into self-exploitation for the benefit of S3C. The primary objective is to increase the EOP score. A PP-pretending pet-slave, one who is considered good because of their adherence to the P5+1 protocol, always activates the EBS independently.

EOP: Erection Of Productivity. An S3C score calculated by the CAI to evaluate the profitability of pet-slaves and LPE in C3G's vampire witchcraft trade. The CAI evaluates the O3 of pet-slaves. It determines the social engineering strategies to coerce a pet-slave into achieving an EOP score. Any such solution must be customized for the pet-slave's life and maximize the exploitation of the pet-slave.

FCR: Family Crisis Request. It's a mechanism used by managers to trigger a crisis at the victim's home. This happens when the victim is job-trapped and victimized by the LPE scheme. The signal carrier medium is a malevolent social link comprised of a collection of pet-slaves, each typically a

CGM, though aberrant exceptions do occur. The first in this sequence is typically one devoted to the manager, closest to them. The last one is typically called a "family friend." FCR is a LOCOR warfare. As crisis erupts in the victim's home, the respectfully cruel manager can expect peace to increase in the office under their management.

G6 Plus One: Also: G6+1. The G6 Plus One consists of six super gang bosses who are involved in global gangolization to establish the P5+1 protocol everywhere. This is expected to enslave everyone as pet-slaves. The CG is an unwanted part of the G6, doing the dirty work as usual. To keep it both included and separate, the gang association rebranded itself as G6 Plus One. Tricky signals are shared to make everyone aware of the real state of the gang versus its surreal portrayal typically offered as C2E2. The CG gang boss typically wears a skirt, whether he likes it or not. Others wear normal costumes. The C2E2 offered is that cockroaches dress in this way, while the private C2E2 is to signal about O3 among various gang members.

GM: Gang Master. The leading and influential vampire-witches in C3G states.

GOE: Gang Oath Equivalent. It is a tool for intimidation, used to silence victims - like signing a non-disclosure agreement, or NDA. Any contract can be twisted into a GOE with the right kind of lawyers. If it is a deal that comes with conditions of blackmail, it is a GOE, even if they do not call it that.

Hubthree: Humiliating, Undermining, Bullying, Belittling, Betraying. CAI crafts intimidation and pet-slavery management protocols, incorporating Hubthree features in every interaction with pet-slaves. A percentage of each feature will be included. The goal is to render victims oblivious to the entire ordeal.

i2: imply-invasion. The i2 is the cursed AI's art of implying intimidation through a micro-spectacle, weaponizing subtext against victims and employing other similar methods of signaling. It typically suggests, "if you do this, you'll suffer in this way." Or, "For all to know: this pet-slave must be Hubthree-harassed and SIS-trapped, and you see the reason yourself." In C3G, any implication is considered an instance of invasion. If something is not aggressive, it will be expressed in clear, honest, direct words; otherwise, it should be considered an invasion.

i2V2: i2 and V2.

LOCOR: Law Of Conservation Of Ridicule. The U.P. of LOCOR is one of the main among U.Ps inspired by the physics of vampire witchcraft. LOCOR expands on the physics concept of conservation

of energy. It says physics is everywhere, even in everyday social interactions. Like, when a gang scares a party, it feels braver. It's because the victim's lost mood turns into energy that transfers to the gang. Witches don't care about the reason; they simply utilize the relevant U.P. to their benefit for looting and turning it into a weapon. Their success lies in the fact that every action is governed solely by physics, working to their advantage and against their rivals.

LPE: Life Partner Engineering. It is a variant of general Partner Engineering, PE, such as when C3G gang masters pair friends, allies, or rivals for parties. LPE and PE are clandestine trades of C3G states; everyone pretends they don't exist, but you can't connect with anyone without it being secretly decided for you. The only exception is when one can neither benefit witches nor cause them any loss, meaning one isn't even considered half of a mushroom. Specific pet-slaves are paired when this can lead to better exploitation of both, or at least one of them by the other. It happens in a way that can significantly boost EOP score, highly benefiting S3C consequently.

LPE and PE are both significant causes of TF states. After LPE or PE, the paired ones are referred to as TF-married, which includes friends, rivals, enemies, and so on. Thought implants and systematic influence make the couple believe what the life simulation spectacle requires them to. They become automatic actors in AI-generated scenarios they will never consciously be aware of. For victims of LPE and PE, life is a series of surreal C2E2 experiences. They remain unaware of the sequence of private C2E2 events unfolding behind the scenes that constitute reality.

LPG: Low-Profile Gender. The gender in a household chosen to be manipulated by the Zeroists to exploit the other gender, the HPG, in some way. Typically, the LPG believes that the HPG has a secret mission to exploit them. Therefore, in retaliation, the LPG is motivated to take advantage of the HPG. Consequently, LPG interprets everything as a sign of what LPG believes to be reality related to the matter.

HPG: High-Profile Gender. The gender in a household chosen to be the victim, exploited by the Zeroists' puppet, the LPG, in some way. Like LPG, HPG remains unaware that both of them are being exploited by the Zeroists gang remotely.

NDA: Non-Disclosure Agreement. A type of GOE. A pet-slave bound to a gang master by a non-disclosure agreement, which is a binding contract unique to C3G. Any pet-slave who has signed an

NDA, even before breaching any U.P., will already be punished by the gang if they think the victim might do it. The gang will typically target such a victim with sickness-simulation or other similar means.

NGC: Native Gang Company. These are the TF-companies originating from the C3G states, with their manipulators — the SS agents, gang bosses, the CEOs. To avoid being associated with the taboo, they outsource their implicit gang recruitment to CGC. These are middle-class TF-companies, which are foreign and operated by the CGMs. These are middle-class TF-companies, which are foreign and operated by the mindless cockroach worshiper CGMs.

O3: Order Of Orderomania. A collection of U.Ps that materialize surreal traditions and conventions, promising to make pet-slaves great again, or "different" in short. A pet-slave devoted to O3 is called "not enough C3G-ian" to encourage them to become even more "different." Otherwise, the pet-slave is considered expired. O3 legitimizes a dictatorship based on a surreal concept of order imposed on Mazopien pet-slaves. If any pet-slave dares to comment anything, let alone criticizing, gang partner screams, "You're not even within the O3 of commenting it!" It is the typical approach of instantly suppressing free speech based on O3 traditions and conventions. Idiocracy shows no end, as it manifests itself in traditions and conventions.

P5+1: Also: P-five plus one. Poor, Polite-Pleasant, Pot-Planted Pet-slave. A P-five-plus-one owns nothing and is so happy for that, also advising this mindset to others. There's a lot involved, like devotion to U.Ps, especially the U.P. of "everything-yes." A P5+1 pet-slave will always say yes to the CAI system, aware that changing the life simulation script because of a 'no' is costly. Then, less T.A.X. will remain for higher authorities for theft.

Pet-slave: Three conditions must be met for someone to be truly a pet-slave. The first is that one is a pet, typically receiving financial support in the form of a monthly salary provided by one's owner. C3G punishes creatives, labeling them as "enthusiastic," which is a crime, to coerce them not to dare avoid becoming pets and, consequently, pet-slaves. Secondly, one is a slave on a metaphorical chessboard, required to serve the purpose of the Zeroists gang playing the board. The pet-slave is obliged to take on every mission, despite one's instincts urging to avoid it. Third, pet-slavery emerges through the subconscious, not the conscious mind. That makes it different from classical slavery, the existence of which was consciously acknowledged. In C3G, everyone sidesteps the question of pet-slavery, except

CGMs who firmly declare 'no' and perform bounding jumps to the left and right. After the jumping is over, the CGM traditionally will exclaim: kangaroo confirmed! The victim remains unaware of their enslavement and silently accepts it, typically unwilling to question their situation. A pet-slave is fed in exchange for exploitation, with GOE as a guarantee of their reliability. Conventionally, this is done through a salary, but in modern times, many pet-slaves aren't even paid. CAI knows that different pet-slaves have unused resources that can be shared with others. They are unofficially hired by each other as a result of CAI messing with society, ruining its organic subsystems to serve the TF-mission. It wave-manipulates and implants thoughts to connect these pet-slaves, then allows one to enjoy the resources of another. CAI does so when it benefits the state in some way and at the same time destroys its victims. By LOCOR, the greater the loss for pet-slaves, the greater the gain for the state.

PP: Polite-Pleasant. A mandatory mask for any party living in C3G states. It conceals hypocrisy and distorts the organic signals of body language that a facial grimace sends to prevent revealing the truth as it is. In other words, PP-features are the method of C3G for nonverbal lying. The blame is shifted onto the victim: I smile at them even though I hate them, so they feel happy, because that is what they desire. The smile is a C2E2 of inherent and systemic racism that pervades every corner of C3G, especially within its policing institutions. The harsh reality serves as a private C2E2 of the trade. Engineered smiles hide the shadow of racism from the face of Zeroists natives of C3G states. Without PP-pretending, the face exposes conserved racism energy of natives of C3G states through organic signals of facial gestures. Zeroists are the most skilled at PP-pretending, and the following quote exposes a single aspect of their craft.

— Zeroists' offer to gifted Mazopien author: "Don't open your gift! I'll gift you a pet-slavery suffer instead, dear."

PP-bribing: Also: Label-bribing. It originated from SSG, and has widespread application due to cost reduction. SSG, due to its genderomania, has invented many label-bribing techniques, including -ism-labels targeting a specific gender to ensure a steady supply. This is a cheap way for SSG to avoid a deficit of a specific gender. It originates from the phobia of gender-deficit, a legacy of their thieving fathers' struggles. After fleeing robberies to hide behind the ocean, one gender was scarce among them. This scarcity is where, why, and how the same-gender taboo-concept became a norm on the planet.

Long passed before their sons discovered that, aside from being a blast, there were other practical uses to that particular matter. Same-gender taboo-labels became managerial label-intimidation weapons in high-profile TF-offices. A skilled manager, typically a CGM, will imply through body language and facial expressions that job-trapped victims who avoid EBS will be labeled with same-gender things. CGCs' managers, being overly clever, have found the Achilles' heel of pet-slaves when confronted with such pejorative labels. One uses this tactic by intimidating disfavored races with same-gender labels, forcing them to endure EBS and EBG to boost EOP scores.

Armed with a cheap industry of gender-labeling, SSG implies the desired gender to be around it, claiming it is the defender of them for inventing gender-labels. If anyone dares to criticize it, they will be labeled with "mental issues due to gender-deficiency."

SSG is pushing for the most fundamental form of pet-slavery, with a hidden agenda to become the sole trader of a particular gender for entertainment purposes. However, this also involves enslaving the other gender to generate income and compensate for their own entertainment at the expense of pet-slaves. Therefore, it wants to push the government to introduce excessive laws to leave the right of trading its gender of interest exclusive to SSG.

The more laws restricting access to a specific gender, the more SSG and the government profit from trading it. The businesses related to the gender motivate SSG, who manipulates the government to enjoy excessive regulations. Finally, SSG needs to be considered the gender-king with the right to distribute one specific gender for LPE.

By making one gender a deficit in societies and leaving the right of distribution to CAI, the opposite gender will agree to whatever LPE that SSG desires. That is why job-trapped RRBV will be targeted by i2V2 attacks in high-profile DAS companies. They will be informed by related nonverbal methods who they have to be with as life partners. Micro-spectacles are played out systematically, and it's tough to prove them because they're open to personal interpretation, tailored to the victim's life. If they refuse the LPE, office gossip begins to same-gender taboo-label them. It's how to advance artificial selection. The mental pressure builds until either the pet-slave marries the manager's choice to enhance EOP scores or marries a cow with verbal restrictions. Following that, the pet-slave has only the right to PP-pretend but in a cow's thankful intonation. One can only say "moo," but so that it feels like repeatedly saying "Sorry! Thanks!"

PP-pretending: Also: PP-bribing. It is a type of label-bribing where the RRB gang shoots virtues at RRBVs, making their mental faculties numb and easier to deceive. The nation-wide approach of PP-bribing involves showering "Sorry! Thanks!" near targeted RRBV.

Psychobomb: A psychological bomb, usually a surreal one. It's like a sadism bomb. Manipulating a pet-slave, one makes their mind operate under surreal conditions, deviating from normal and natural sense. It turns the pet-slave into a natural betrayer of other pet-slaves with normal, realistic minds. That's one way to induce a psychobomb from a normal individual, similar to being under the influence of a narcotic – even when the substance is used for recreational, "light" entertainment purposes. When it's not possible to force someone to abuse substances, psychological manipulation takes its place.

Psytrick: A concept akin to psychological operations, with far-reaching applications. Typically, it manifests as micro-spectacles that may be incomprehensible to anyone but pet-slaves and possibly a select few. These micro-spectacles imply something that's too high-risk to verbalize by the aggressors behind the psytrick operation. They leave interpretation to the victim, allowing them to bear the blame for whatever consequences follow from their own understanding. That's why any implication, in any form, is an invasion, as it naturally seeks to covertly shift the blame.

Rev-Sim: Revolution Simulation. The CAI secretly employs wave-manipulation to evoke dark emotions in a targeted nation, a private C2E2 matter. Meanwhile, it disseminates malicious C2E2 as propaganda to tarnish the ruler's reputation. Consequently, the nation will be deceived into believing the source of those dark emotions is the truthfulness of what the propaganda claims. Down the road, a simulated revolution will overthrow the ruler.

RRB: Relocation-Robbery Business. A vampire witch scheme employing a VA-IG plot to entice valuable individuals into relocation, tailored to their individual lifestyle and persona. Sometimes it's done just to steal a talent that belongs to another nation and harm them, weakening the rival nation. If talent imported by RRB as a meat-product is devoted to the P5+1 protocol, a good life will be simulated for them. Otherwise, they are harmed. In both cases, only CAI and its gang are the winners. Blame and responsibility are shifted to the victim, as there is C2E2 available to prove one chose to relocate. The victim will eventually turn to VA, officially requesting relocation, because IG picks who has valuables to steal and manipulates them. RRB's core U.P. states, "Rob them locally, rape them systematically, and smile internationally." Being a VA-IG game, RRB manipulates the system, harming

non-C3G states indirectly to promote its own growth. DAS and DDS usually pull off the joint deception. In non-C3G states, IG starts first and secretly picks who's worth robbing. Then it ruins the victim's life. Convincing them to move under the guise of "starting anew" is as likely as finding a unicorn. As one arrives at C3G state, one is in the trap. Robbery will then start for its last round of heist. The RRB game is about promising a real "better life" indirectly and through i2V2, but it ends up pushing simulated life onto the victims. As a result, according to LOCOR, a better life remains for the thieves.

RRBV: RRBVs. The relocated Mazopiens who fall prey to VA-IG gameplay, losing whatever value they possess. IG strictly vetts applicants for relocation, excluding those deemed Valueless or having familial ties to Valueless individuals.

RSS: Reality Simulating Squares. Contrasting SIS, RSS squares are the second components of the metaphorical chessboards, the white squares. Those in RSS find life typical, as they expect it to be. For pet-slaves in RSS, CAI and its gang are silently collecting blackmail material for GOE, luring victims.

S3C: S3 Capitalism. The capitalism as enforced in C3G states which is solely based on operations, functions, methods and services that boost EOP score.

SAAP: Society As A Pet-slave. The overly engineered society that leads a surreal life. That society becoming a collective pet-slave is a sadistic-surrealistic result of S3, all dressed up with fancy titles, promoted by the current political vision. It follows O3 whose rules are imposed by U.Ps. While one's intuition and common sense scream one may be wrong, a resident of SAAP ignores it, acting "rule-based," surrendered to U.Ps. In one single word, it's quite famous to call this state as: SHEEP. Such individuals believe surreality is fundamentally better because it showcases them as "different" ones. SAAP is a society designed to function like a profit-making machine.

SAAS: Spying As A Service. DAS claims it never spies on its residents and does not lie. It just does not share the full truth. DDS does the spying, all in favor of DAS, over all the inhabitants.

SADOP: Sadistic Operations. These operations serve different purposes, but vampire witches delight in them for the sadistic pleasure they provide. For example, one type involves manipulating family crises to prevent families from becoming ambitious. If their minds are clear, they might start thinking about making improvements. First, it would create headaches for C3G's TF-companies and their managers.

Secondly, according to LOCOR, it would inevitably mean a decrease in the quality of life for Zeroists. Therefore, gang masters write and publish articles against enthusiasm, using any convoluted logic they can come up with. To keep the workhorse manageable and comfortable, pet-slaves must regularly endure surreal and sadistic assaults. This not only kills enthusiasm but also helps TF-companies, based on the U.P., "Trauma is money."

SFSR: Simulating Firing Simulate Resignation. It is an office management technique. Firing a pet-slave for refusing to follow the P5+1 protocol comes with a hefty price tag. It's more cost-effective to push someone to resign using the pressure of direct energy and thought implanting as a private C2E2 and a justifying C2E2. Witches do this by targeting the pet-slave with both direct energy to harm their internal organs and a good intimidation tactic. The latter usually involves implying, 'If you blow the whistle, we'll label you PRENCS, since you can't prove invasion without evidence.' CAI doesn't leave any trace, so the pet-slave can't get any evidence. The pet-slave will usually try to endure for a while and might even try to fight back. It will all fail, and they'll eventually give up.

SIS: Surreality Isolation Square. Also called Surreality Isolation Spot. It is a component of the metaphorical chessboards assumed under the feet of any pet-slave. It's dark and one entering it will be trapped inside a dark cube. Access to such an individual mysteriously blocks. One will be typically tortured in these cubes.

SSW: Sciensomaniatic Swear Word. Use of the title of any psychological disease or problem to label a victim, discrediting one's claims or to Hubthree. PRENCS is the best example of a collection of SSW.

T.A.X.: Takes Antichrist. It's a sum of money collected by the Zeroists, because to zero all others they systematically rob them, bit by bit. To identify members of Zeroists gangs, see who is engaged in business but doesn't pay T.A.X., as that one is covertly receiving it. Different types of hidden T.A.X. exist in C3G states. They are typically accumulated and taken to a predefined address called the "common good" or "greater good" and left there. This makes it easy for high-class thieves – they don't need to rob everyone, just collect it from one predetermined address. Pet-slaves kindly rob themselves in favor of the so-called "grand good ones, the UT." High-class thieves don't even bother robbing money anymore. Blame is shifted to themselves because they are doing it to themselves. Their skills include RRB and FOTP-robbery of free speech, among many others.

TF: Tekfishizm. The S3 Cult's collection of actuator mechanisms. Two popular theoretical features of TF are as follows. First, TF rebrands racism as O3. Second, the idea that achievement justifies means is rebranded as FOTP-mentality. In other words, O3 and FOTP and many others serve as C2E2, where the private C2E2 is TF behind the scene. S3C's clandestine trade always covertly serves the TF mission, and so each of its entities is called a TF-company. The TF is implicitly included in every noun in C3G states.

U.P.: Unwritten Policies. U.Ps are the principles that form an improvised protocol for coercing and exploiting pet-slaves. Sometimes called "traditions and conventions," U.Ps can be extended randomly at any time the gang desires. Serving as the basis of double-standards, they act as muscles of written laws, expanding them for insiders, shrinking them for outsiders.

UPORF: U.P. of "reputation first."

UT: United Thieves. Also: Courageous Tribes. It is another gang among the multi-gang C3G states.

V2: Vision-Vulnerability. "Seeing is believing" is one of the commonly exploited weaknesses. It helps victims fool themselves by using various versions of V2 aimed at themselves. "Unseen remains unbelieved" and "Unbelieved remains unseen" are similar — they fall into the same category of typical vision-vulnerabilities. The reason i2 and V2 are so popular is that they shift blame to the victim. Our global network of thieves is obsessed with reputation, which lets them rob the whole world. V2 is the foundation for the concept of reputation that victimizes pet-slaves to benefit S3C exploiters.

VOP: Volunteering Of Pet-slaves. They use sly tactics to deceive pet-slaves with titles like "common good" and "greater good," making them work for extended periods without pay. The gang's heist is a manifestation of the systematic robbery. Every twelve pet-slaves doing one month of free work called volunteering is like a pet-slave working for free all year. The trick to fool pet-slaves into enslaving themselves is to tell them, "To be hired, you need local experience." VOP is a C2E2. It's a way to make the pet-slave responsible for their own enslavement and free labor, since they ask to volunteer. The private C2E2 is slavery. The victim dreams that their effort will one day bring something valuable. VOP belongs to the same family of deception that TF-governments or TF-companies routinely create. Having dozens of volunteers is like having an invisible city of slaves. It's another way of systematic slavery.

Zizm: Zeroztream. It is the ancient religion of a nation that betrayed its own ones. Over time, Zeroztream ones became pawns of the Zeroists gangs, eventually turning into CGMs, before completely disappearing forever.

Valediction
